Obtaining Gmsh

The source code and pre-compiled binary versions of Gmsh (for Windows, macOS and Linux) can be downloaded from https://gmsh.info. Gmsh packages are also directly available in various Linux and BSD distributions (Debian, Fedora, Ubuntu, FreeBSD, ...).

Copying conditions

Gmsh is free software; this means that everyone is free to use it and to redistribute it on a free basis. Gmsh is not in the public domain; it is copyrighted and there are restrictions on its distribution, but these restrictions are designed to permit everything that a good cooperating citizen would want to do. What is not allowed is to try to prevent others from further sharing any version of Gmsh that they might get from you.

Specifically, we want to make sure that you have the right to give away copies of Gmsh, that you receive source code or else can get it if you want it, that you can change Gmsh or use pieces of Gmsh in new free programs, and that you know you can do these things.

To make sure that everyone has such rights, we have to forbid you to deprive anyone else of these rights. For example, if you distribute copies of Gmsh, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must tell them their rights.

Also, for our own protection, we must make certain that everyone finds out that there is no warranty for Gmsh. If Gmsh is modified by someone else and passed on, we want their recipients to know that what they have is not what we distributed, so that any problems introduced by others will not reflect on our reputation.

The precise conditions of the license for Gmsh are found in the General Public License that accompanies the source code (see Appendix F [License], page 413). Further information about this license is available from the GNU Project webpage https://www.gnu.org/copyleft/gpl-faq.html. Detailed copyright information can be found in Appendix E [Copyright and credits], page 409.

If you want to integrate parts of Gmsh into a closed-source software, or want to sell a modified closed-source version of Gmsh, you will need to obtain a different license. Please contact us directly for more information.
Reporting a bug

If, after reading this reference manual, you think you have found a bug in Gmsh, please file an issue on https://gitlab.onelab.info/gmsh/gmsh/issues. Provide as precise a description of the problem as you can, including sample input files that produce the bug. Don’t forget to mention both the version of Gmsh and your operation system.

See Appendix C [Frequently asked questions], page 379, and the bug tracking system to see which problems we already know about.
# Overview of Gmsh

Gmsh is a three-dimensional finite element mesh generator with a build-in CAD engine and post-processor. Its design goal is to provide a fast, light and user-friendly meshing tool with parametric input and flexible visualization capabilities.

Gmsh is built around four modules (geometry, mesh, solver and post-processing), which can be controlled with the graphical user interface (GUI; see Chapter 3 [Gmsh graphical user interface], page 79), from the command line (see Chapter 4 [Gmsh command-line interface], page 85), using text files written in Gmsh’s own scripting language (.geo files; see Chapter 5 [Gmsh scripting language], page 91), or through the C++, C, Python, Julia and Fortran application programming interface (API; see Chapter 6 [Gmsh application programming interface], page 125).

A brief description of the four modules is given hereafter, before an overview of what Gmsh does best (... and what it is not so good at), and some practical information on how to install and run Gmsh on your computer.

## 1.1 Geometry module

A model in Gmsh is defined using its Boundary Representation (BRep): a volume is bounded by a set of surfaces, a surface is bounded by a series of curves, and a curve is bounded by two end points. Model entities are topological entities, i.e., they only deal with adjacencies in the model, and are implemented as a set of abstract topological classes. This BRep is extended by the definition of embedded, or internal, model entities: internal points, curves and surfaces can be embedded in volumes; and internal points and curves can be embedded in surfaces.

The geometry of model entities can be provided by different CAD kernels. The two default kernels interfaced by Gmsh are the built-in kernel and the OpenCASCADE kernel. Gmsh does not translate the geometrical representation from one kernel to another, or from these kernels to some neutral representation. Instead, Gmsh directly queries the native data for each CAD kernel, which avoids data loss and is crucial for complex models where translations invariably introduce issues linked to slightly different representations. Selecting the CAD kernel in .geo scripts is done with the SetFactory command (see Section 5.2 [Geometry scripting commands], page 104), while in the Gmsh API the kernel appears explicitly in all the relevant functions from the gmsh/model namespace, with geo or occ prefixes for the built-in and OpenCASCADE kernel, respectively (see Section 6.3 [Namespace gmsh/model], page 130).

Entities can either be built in a bottom-up manner (first points, then curves, surfaces and volumes) with the built-in and OpenCASCADE kernels, or in a top-down constructive solid geometry fashion (solids on which boolean operations are performed) with the OpenCASCADE kernel. Both methodologies can also be combined. Finally, groups of model entities (called “physical groups”) can be defined, based on the elementary geometric entities. (See Section 1.2.3 [Elementary entities vs physical groups], page 11, for more information about how physical groups affect the way meshes are saved.)

Both model entities (also referred to as “elementary entities”) and physical groups are uniquely defined by a pair of integers: their dimension (0 for points, 1 for curves, 2 for surfaces, 3 for volumes) and their tag, a strictly positive global identification number. Entity and group tags are unique per dimension:

1. each point must possess a unique tag;
2. each curve must possess a unique tag;
3. each surface must possess a unique tag;
4. each volume must possess a unique tag.

Zero or negative tags are reserved by Gmsh for internal use.
Model entities can be manipulated and transformed in a variety of ways within the geometry module, but operations are always performed directly within their respective CAD kernels. As explained above, there is no common internal geometrical representation: rather, Gmsh directly performs the operations (translation, rotation, intersection, union, fragments, ...) on the native geometrical representation using each CAD kernel’s own API. In the same philosophy, models can be imported in the geometry module through each CAD kernel’s own import mechanisms. For example, by default Gmsh imports STEP and IGES files through OpenCASCADE, which will lead to the creation of model entities with an internal OpenCASCADE representation.

The Chapter 2 [Gmsh tutorial], page 15, starting with Section 2.1 [t1], page 15, is the best place to learn how to use the geometry module: it contains examples of increasing complexity based on both the built-in and the OpenCASCADE kernel. Note that many features of the geometry module can be used interactively in the GUI (see Chapter 3 [Gmsh graphical user interface], page 79), which is also a good way to learn about both Gmsh’s scripting language and the API, as actions in the geometry module automatically append the related command in the input script file, and can optionally also generate input for the languages supported by the API (see the General.ScriptingLanguages option; this is still work-in-progress as of Gmsh 4.11.)

In addition to CAD-type geometrical entities, whose geometry is provided by a CAD kernel, Gmsh also supports discrete model entities, which are defined by a mesh (e.g. STL). Gmsh does not perform geometrical operations on such discrete entities, but they can be equipped with a geometry through a so-called “reparametrization” procedure¹. The parametrization is then used for meshing, in exactly the same way as for CAD entities. See Section 2.13 [t13], page 43 for an example.

### 1.2 Mesh module

A finite element mesh of a model is a tessellation of its geometry by simple geometrical elements of various shapes (in Gmsh: lines, triangles, quadrangles, tetrahedra, prisms, hexahedra and pyramids), arranged in such a way that if two of them intersect, they do so along a face, an edge or a node, and never otherwise. This defines a so-called conformal mesh. The mesh module implements several algorithms to generate such meshes automatically. By default, meshes produced by Gmsh are considered as unstructured, even if they were generated in a structured way (e.g., by extrusion). This implies that the mesh elements are completely defined simply by an ordered list of their nodes, and that no predefined ordering relation is assumed between any two elements.

In order to guarantee the conformity of the mesh, mesh generation is performed in a bottom-up flow: curves are discretized first; the mesh of the curves is then used to mesh the surfaces; then the mesh of the surfaces is used to mesh the volumes. In this process, the mesh of an entity is only constrained by the mesh of its boundary, unless entities of lower dimensions are explicitly embedded in entities of higher dimension. For example, in three dimensions, the triangles discretizing a surface will be forced to be faces of tetrahedra in the final 3D mesh only if the surface is part of the boundary of a volume, or if that surface has been explicitly embedded in the volume. This automatically ensures the conformity of the mesh when, for example, two volumes share a common surface. Every meshing step is constrained by a mesh size field, which prescribes the desired size of the elements in the mesh. This size field can be uniform, specified by values associated with points in the geometry, or defined by general mesh size fields (for example related to the distance to some boundary, to a arbitrary scalar field defined on another mesh, etc.): see Chapter 8 [Gmsh mesh size fields], page 303. For each meshing step, all structured mesh directives are executed first, and serve as additional constraints for the unstructured parts. (The generation and handling of conformal meshes has important consequences on how meshes

---

are stored internally in Gmsh, and how they are accessed through the API: see Chapter 6 [Gmsh application programming interface], page 125.)

Gmsh’s mesh module regroups several 1D, 2D and 3D meshing algorithms:

- The 2D unstructured algorithms generate triangles and/or quadrangles (when recombination commands or options are used). The 3D unstructured algorithms generate tetrahedra, or tetrahedra and pyramids (when the boundary mesh contains quadrangles).

- The 2D structured algorithms (transfinite and extrusion) generate triangles by default, but quadrangles can be obtained by using the recombination commands or options. The 3D structured algorithms generate tetrahedra, hexahedra, prisms and pyramids, depending on the type of the surface meshes they are based on.

All meshes can be subdivided to generate fully quadrangular or fully hexahedral meshes with the Mesh.SubdivisionAlgorithm option (see Section 7.4 [Mesh options], page 259).

1.2.1 Choosing the right unstructured algorithm

Gmsh provides a choice between several 2D and 3D unstructured algorithms. Each algorithm has its own advantages and disadvantages.

For all 2D unstructured algorithms a Delaunay mesh that contains all the points of the 1D mesh is initially constructed using a divide-and-conquer algorithm. Missing edges are recovered using edge swaps. After this initial step several algorithms can be applied to generate the final mesh:

- The “MeshAdapt” algorithm is based on local mesh modifications. This technique makes use of edge swaps, splits, and collapses: long edges are split, short edges are collapsed, and edges are swapped if a better geometrical configuration is obtained.

- The “Delaunay” algorithm is inspired by the work of the GAMMA team at INRIA. New points are inserted sequentially at the circumcenter of the element that has the largest adimensional circumradius. The mesh is then reconnected using an anisotropic Delaunay criterion.

- The “Frontal-Delaunay” algorithm is inspired by the work of S. Rebay.

- Other experimental algorithms with specific features are also available. In particular, “Frontal-Delaunay for Quads” is a variant of the “Frontal-Delaunay” algorithm aiming at generating right-angle triangles suitable for recombination; and “BAMG” allows to generate anisotropic triangulations.

For very complex curved surfaces the “MeshAdapt” algorithm is the most robust. When high element quality is important, the “Frontal-Delaunay” algorithm should be tried. For very large meshes of plane surfaces the “Delaunay” algorithm is the fastest; it usually also handles complex mesh size fields better than the “Frontal-Delaunay”. When the “Delaunay” or “Frontal-

---

Delaunay” algorithms fail, “MeshAdapt” is automatically triggered. The “Automatic” algorithm uses “Delaunay” for plane surfaces and “MeshAdapt” for all other surfaces.

Several 3D unstructured algorithms are also available:

- The “Delaunay” algorithm is split into three separate steps. First, an initial mesh of the union of all the volumes in the model is performed, without inserting points in the volume. The surface mesh is then recovered using H. Si’s boundary recovery algorithm Tetgen/BR. Then a three-dimensional version of the 2D Delaunay algorithm described above is applied to insert points in the volume to respect the mesh size constraints.
- The “Frontal” algorithm uses J. Schoeberl’s Netgen algorithm.\(^9\)
- The “HXT” algorithm\(^10\) is a new efficient and parallel reimplementation of the Delaunay algorithm.
- Other experimental algorithms with specific features are also available. In particular, “MMG3D”\(^11\) allows to generate anisotropic tetrahedralizations.

The “Delaunay” algorithm is currently the most robust and is the only one that supports the automatic generation of hybrid meshes with pyramids. Embedded model entities and general mesh size fields (see Section 1.2.2 [Specifying mesh element sizes], page 10) are currently only supported by the “Delaunay” and “HXT” algorithms.

When Gmsh is configured with OpenMP support (see Appendix A [Compiling the source code], page 373), most of the meshing steps can be performed in parallel:

- 1D and 2D meshing is parallelized using a coarse-grained approach, i.e. curves (resp. surfaces) are each meshed sequentially, but several curves (resp. surfaces) can be meshed at the same time.
- 3D meshing using HXT is parallelized using a fine-grained approach, i.e. the actual meshing procedure for a single volume is done in parallel.

The number of threads can be controlled with the -nt flag on the command line (see Chapter 4 [Gmsh command-line interface], page 85), or with the General.NumThreads, Mesh.MaxNumThreads1D, Mesh.MaxNumThreads2D and Mesh.MaxNumThreads3D options (see Section 7.1 [General options], page 223 and Section 7.4 [Mesh options], page 259).

### 1.2.2 Specifying mesh element sizes

There are several ways to specify the size of the mesh elements for a given geometry:

1. First, if the options Mesh.MeshSizeFromPoints and Mesh.MeshSizeExtendFromBoundary are set (they are by default; see Section 7.4 [Mesh options], page 259), you can simply specify desired mesh element sizes at the geometrical points of the model. The size of the mesh elements will then be computed by interpolating these values inside the domain during mesh generation. This might sometimes lead to over-refinement in some areas, so that you may have to add “dummy” geometrical entities in the model in order to get the desired element sizes or use more advanced methods explained below.

2. Second, if Mesh.MeshSizeFromCurvature is set to a positive value (it is set to 0 by default), the mesh will be adapted with respect to the curvature of the model entities, the value giving the target number of elements per 2 Pi radians.

3. Next, you can specify a general target mesh size, expressed as a combination of mesh size fields (see Chapter 8 [Gmsh mesh size fields], page 303):

Chapter 1: Overview of Gmsh

- The **Box** field specifies the size of the elements inside and outside of a parallelepipedic region.
- The **Distance** field specifies the size of the mesh according to the distance to some model entities.
- The **MathEval** field specifies the size of the mesh using an explicit mathematical function.
- The **PostView** field specifies an explicit background mesh in the form of a scalar post-processing view (see Section 1.4 [Post-processing module], page 12, and Chapter 10 [Gmsh file formats], page 349) in which the nodal values are the target element sizes. This method is very general but it requires a first (usually rough) mesh and a way to compute the target sizes on this mesh (usually through an error estimation procedure, e.g. in an iterative process of mesh adaptation).
- The **Min** field specifies the size as the minimum of the sizes computed using other fields.

4. Mesh sizes are also constrained by structured meshing constraints (e.g. transfinite or extruded meshes) as well as by any discrete model entity that is not equipped with a geometry, and which will thus preserve it mesh during mesh generation.

5. Boundary mesh sizes are interpolated inside surfaces and/or volumes depending on the value of **Mesh.MeshSizeExtendFromBoundary**.

To determine the actual mesh size at any given point in the model, Gmsh evaluates all the above mesh size constraints and selects the smallest value. Using the Gmsh API, this value can then be further modified using a C++, C, Python, Julia or Fortran mesh size callback function provided via `gmsh/model/mesh/setSizeCallback` (see Section 6.4 [Namespace gmsh/model/mesh], page 142).

The resulting value is further constrained in the interval `[Mesh.MeshSizeMin, Mesh.MeshSizeMax]` (which can also be provided on the command line with `-clmin` and `-clmax`). The resulting value is then finally multiplied by **Mesh.MeshSizeFactor** (`-clscale` on the command line).

Note that when the element size is fully specified by a mesh size field, it is thus often desirable to set

```c
Mesh.MeshSizeFromPoints = 0;
Mesh.MeshSizeFromCurvature = 0;
Mesh.MeshSizeExtendFromBoundary = 0;
```

to prevent over-refinement inside an entity due to small mesh sizes on its boundary.

### 1.2.3 Elementary entities vs. physical groups

It is usually convenient to combine elementary geometrical entities into more meaningful groups, e.g. to define some mathematical (“domain”, “boundary with Neumann condition”), functional (“left wing”, “fuselage”) or material (“steel”, “carbon”) properties. Such grouping is done in Gmsh’s geometry module (see Section 1.1 [Geometry module], page 7) through the definition of “physical groups”.

By default in the native Gmsh MSH mesh file format (see Chapter 10 [Gmsh file formats], page 349), as well as in most other mesh formats, if physical groups are defined, the output mesh only contains those elements that belong to at least one physical group. (Different mesh file formats treat physical groups in slightly different ways, depending on their capability to define groups.) To save all mesh elements whether or not physical groups are defined, use the **Mesh.SaveAll** option (see Section 7.4 [Mesh options], page 259) or specify `-save_all` on the command line. In some formats (e.g. MSH2), setting `Mesh.SaveAll` will however discard all physical group definitions.
1.3 Solver module

Gmsh implements a ONELAB (http://onelab.info) server to exchange data with external solvers or other codes (called “clients”). The ONELAB interface allows to call such clients and have them share parameters and modeling information.

The implementation is based on a client-server model, with a server-side database and local or remote clients communicating in-memory or through TCP/IP sockets. Contrary to most solver interfaces, the ONELAB server has no a priori knowledge about any specifics (input file format, syntax, ...) of the clients. This is made possible by having any simulation preceded by an analysis phase, during which the clients are asked to upload their parameter set to the server. The issues of completeness and consistency of the parameter sets are completely dealt with on the client side: the role of ONELAB is limited to data centralization, modification and re-dispatching.

Using the Gmsh API, you can directly embed Gmsh in your C++, C, Python, Julia or Fortran solver, use ONELAB for interactive parameter definition and modification, and to create post-processing data on the fly. See prepro.py, custom_gui.py and custom_gui.cpp for examples.

If you prefer to keep codes separate, you can also communicate with Gmsh through a socket by providing the solver name (Solver.Name0, Solver.Name1, etc.) and the path to the executable (Solver.Executable0, Solver.Executable1, etc.). Parameters can then be exchanged using the ONELAB protocol: see the utils/solvers directory for examples. A full-featured solver interfaced in this manner is GetDP (https://getdp.info), a general finite element solver using mixed finite elements.

1.4 Post-processing module

The post-processing module can handle multiple scalar, vector or tensor datasets along with the geometry and the mesh. The datasets can be given in several formats: in human-readable “parsed” format (these are just part of a standard input script, but are usually put in separate files with a ‘.pos’ extension – see Section 5.4 [Post-processing scripting commands], page 119), in native MSH files (ASCII or binary files with ‘.msh’ extensions: see Chapter 10 [Gmsh file formats], page 349), or in standard third-party formats such as CGNS or MED. Datasets can also be directly imported using the Gmsh API (see Section 6.10 [Namespace gmsh/view], page 204).

Once loaded into Gmsh, scalar fields can be displayed as iso-curves, iso-surfaces or color maps, whereas vector fields can be represented either by three-dimensional arrows or by displacement maps. Tensor fields can be displayed as Von-Mises effective stresses, min/max eigenvalues, eigenvectors, ellipses or ellipsoids. (To display other combinations of components, you can use the View.ForceNumComponents option – see Section 7.6 [Post-processing options], page 284.)

Each dataset, along with the visualization options, is called a “post-processing view”, or simply a “view”. Each view is given a name, and can be manipulated either individually (each view has its own button in the GUI and can be referred to by its index or its unique tag in a script or in the API) or globally (see the PostProcessing.Link option in Section 7.6 [Post-processing options], page 284). Possible operations on post-processing views include section computation, offset, elevation, boundary and component extraction, color map and range modification, animation, vector graphic output, etc. These operations are either carried out nondestructively through the modification of post-processing options, or can lead to the actual modification of the view data or the creation of new views when done using post-processing plugins (see Chapter 9 [Gmsh plugins], page 321). Both can be fully automated in scripts or through the API (see e.g., Section 2.8 [t8], page 33, and Section 2.9 [t9], page 36).

By default, Gmsh treats all post-processing views as three-dimensional plots, i.e., draws the scalar, vector and tensor primitives (points, curves, triangles, tetrahedra, etc.) in 3D space. But Gmsh can also represent each post-processing view containing scalar points as two-dimensional (“X-Y”) plots, either space- or time-oriented:
• in a ‘2D space’ plot, the scalar points are taken in the same order as they are defined in the post-processing view: the abscissa of the 2D graph is the curvilinear abscissa of the curve defined by the point series, and only one curve is drawn using the values associated with the points. If several time steps are available, each time step generates a new curve;
• in a ‘2D time’ plot, one curve is drawn for each scalar point in the view and the abscissa is the time step.

1.5 What Gmsh is pretty good at . . .

Here is a tentative list of what Gmsh does best:

• quickly describe simple and/or “repetitive” geometries with the built-in scripting language, thanks to user-defined macros, loops, conditionals and includes (see Section 5.1.7 [User-defined macros], page 98, Section 5.1.8 [Loops and conditionals], page 98, and Section 5.1.9 [Other general commands], page 99). For more advanced geometries, using the Gmsh API (see Chapter 6 [Gmsh application programming interface], page 125) in the language of your choice (C++, C, Python, Julia or Fortran) brings even greater flexibility, the only downside being that you need to either compile your code (for C++, C and Fortran) or to configure and install an interpreter (Python or Julia) in addition to Gmsh. A binary Software Development Kit (SDK) is distributed on the Gmsh web site to make the process easier (see Section 1.7 [Installing and running Gmsh on your computer], page 14);
• parametrize these geometries. Gmsh’s scripting language or the Gmsh API enable all commands and command arguments to depend on previous calculations. Using the OpenCASCADE geometry kernel, Gmsh gives access to all the usual constructive solid geometry operations (see e.g. Section 2.16 [t16], page 49);
• import geometries from other CAD software in standard exchange formats. Gmsh uses OpenCASCADE to import such files, including label and color information from STEP and IGES files (see e.g. Section 2.20 [t20], page 55);
• generate unstructured 1D, 2D and 3D simplicial (i.e., using line segments, triangles and tetrahedra) finite element meshes (see Section 1.2 [Mesh module], page 8), with fine control over the element size (see Section 1.2.2 [Specifying mesh element sizes], page 10);
• create simple extruded geometries and meshes, and allow to automatically couple such structured meshes with unstructured ones (using a layer of pyramids in 3D);
• generate high-order (curved) meshes that conform to the CAD model geometry. High-order mesh optimization tools allow to guarantee the validity of such curved meshes;
• interact with external solvers by defining ONELAB parameters, shared between Gmsh and the solvers and easily modifiable in the GUI (see Section 1.3 [Solver module], page 12);
• visualize and export computational results in a great variety of ways. Gmsh can display scalar, vector and tensor datasets, perform various operations on the resulting post-processing views (see Section 1.4 [Post-processing module], page 12), can export plots in many different formats, and can generate complex animations (see e.g. Section 2.8 [t8], page 33);
• run on low end machines and/or machines with no graphical interface. Gmsh can be compiled with or without the GUI (see Appendix A [Compiling the source code], page 373), and all versions can be used either interactively or directly from the command line;
• configure your preferred options. Gmsh has a large number of configuration options that can be set interactively using the GUI, scattered inside script files, changed through the API, set in per-user configuration files and specified on the command line (see Chapter 7 [Gmsh options], page 223);
• and do all the above on various platforms (Windows, macOS and Linux), for free (see [Copying conditions], page 3)!
1.6 . . . and what Gmsh is not so good at

Here are some known weaknesses of Gmsh:

- Gmsh is not a multi-bloc mesh generator: all meshes produced by Gmsh are conforming in the sense of finite element meshes;
- Gmsh’s graphical user interface is only exposing a limited number of the available features, and many aspects of the interface could be enhanced (especially manipulators).
- Your complaints about Gmsh here :-)

If you have the skills and some free time, feel free to join the project: we gladly accept any code contributions (see Appendix B [Information for developers], page 377) to remedy the aforementioned (and all other) shortcomings!

1.7 Installing and running Gmsh on your computer

Gmsh can be used either as a standalone application, or as a library.

As a standalone application, Gmsh can be controlled with the GUI (see Chapter 3 [Gmsh graphical user interface], page 79), through the command line (see Chapter 4 [Gmsh command-line interface], page 85) and through '.geo' script files (see Chapter 5 [Gmsh scripting language], page 91). In addition, the ONELAB interface (see Section 1.3 [Solver module], page 12) allows to interact with the Gmsh application through Unix or TCP/IP sockets. Binary versions of the Gmsh app for Windows, Linux and macOS can be downloaded from https://gmsh.info/#Download. Several Linux distributions also ship the Gmsh app. See Appendix A [Compiling the source code], page 373 for instructions on how to compile the Gmsh app from source.

As a library, Gmsh can still be used in the same way as the standalone Gmsh app, but in addition it can also be embedded in external codes using the Gmsh API (see Chapter 6 [Gmsh application programming interface], page 125). The API is available in C++, C, Python, Julia and Fortran. A binary Software Development Kit (SDK) for Windows, Linux and macOS, that contains the dynamic Gmsh library and the associated header and module files, can be downloaded from https://gmsh.info/#Download. Python users can use

    pip install --upgrade gmsh

which will download the binary SDK and install the files in the appropriate system directories. Several Linux distributions also ship the Gmsh SDK. See Appendix A [Compiling the source code], page 373 for instructions on how to compile the dynamic Gmsh library from source.
2 Gmsh tutorial

The following tutorials introduce new features gradually, starting with the first tutorial t1 (see Section 2.1 [t1], page 15). The corresponding files are available in the tutorials directory of the Gmsh distribution.

The ‘.geo’ files (e.g. ‘t1.geo’) are written in Gmsh’s built-in scripting language (see Chapter 5 [Gmsh scripting language], page 91). You can open them directly with the Gmsh app: in the GUI (see Chapter 3 [Gmsh graphical user interface], page 79), use the ‘File>Open’ menu and select e.g. ‘t1.geo’. Or on the command line, run

> gmsh t1.geo

which will launch the GUI, or run

> gmsh t1.geo -2

to perform 2D meshing in batch mode (see Chapter 4 [Gmsh command-line interface], page 85).

The ‘c++’, ‘c’, ‘python’, ‘julia’ and ‘fortran’ subdirectories of the tutorials directory contain the C++, C, Python, Julia and Fortran versions of the tutorials, written using the Gmsh API (see Chapter 6 [Gmsh application programming interface], page 125). You will need the Gmsh dynamic library and the associated header files (for C++ and C) or modules (for Python, Julia and Fortran) to run them (see Section 1.7 [Installing and running Gmsh on your computer], page 14). Each subdirectory contains additional information on how to run the tutorials for each supported language.

All the tutorials starting with the letter ‘t’ are available both using the scripting language and the API. Extended tutorials, starting with the letter ‘x’, introduce features that are only available through the API.

Note that besides these tutorials, the Gmsh distribution contains many other examples written using both the built-in scripting language and the API: see examples and benchmarks.

2.1 t1: Geometry basics, elementary entities, physical groups

See t1.geo. Also available in C++ (t1.cpp), C (t1.c), Python (t1.py), Julia (t1.jl) and Fortran (t1.f90).

```plaintext
// -----------------------------------------------------------------------------
// // Gmsh GEO tutorial 1
// // Geometry basics, elementary entities, physical groups
// // -----------------------------------------------------------------------------

// The simplest construction in Gmsh’s scripting language is the
```
// 'affectation'. The following command defines a new variable 'lc':

lc = 1e-2;

// This variable can then be used in the definition of Gmsh's simplest
// 'elementary entity', a 'Point'. A Point is uniquely identified by a tag (a
// strictly positive integer; here '1') and defined by a list of four numbers:
// three coordinates (X, Y and Z) and the target mesh size (lc) close to the
// point:

Point(1) = {0, 0, 0, lc};

// The distribution of the mesh element sizes will then be obtained by
// interpolation of these mesh sizes throughout the geometry. Another method to
// specify mesh sizes is to use general mesh size Fields (see 't10.geo'). A
// particular case is the use of a background mesh (see 't7.geo').

// If no target mesh size of provided, a default uniform coarse size will be
// used for the model, based on the overall model size.

// We can then define some additional points. All points should have different
// tags:

Point(2) = {.1, 0, 0, lc};
Point(3) = {.1, .3, 0, lc};
Point(4) = {0, .3, 0, lc};

// Curves are Gmsh's second type of elementary entities, and, amongst curves,
// straight lines are the simplest. A straight line is identified by a tag and
// is defined by a list of two point tags. In the commands below, for example,
// the line 1 starts at point 1 and ends at point 2.

// Note that curve tags are separate from point tags - hence we can reuse tag
// '1' for our first curve. And as a general rule, elementary entity tags in
// Gmsh have to be unique per geometrical dimension.

Line(1) = {1, 2};
Line(2) = {3, 2};
Line(3) = {3, 4};
Line(4) = {4, 1};

// The third elementary entity is the surface. In order to define a simple
// rectangular surface from the four curves defined above, a curve loop has
// first to be defined. A curve loop is also identified by a tag (unique amongst
// curve loops) and defined by an ordered list of connected curves, a sign being
// associated with each curve (depending on the orientation of the curve to form
// a loop):

Curve Loop(1) = {4, 1, -2, 3};

// We can then define the surface as a list of curve loops (only one here,
// representing the external contour, since there are no holes--see 't4.geo' for
// an example of a surface with a hole):

Plane Surface(1) = {1};

// At this level, Gmsh knows everything to display the rectangular surface 1 and
// to mesh it. An optional step is needed if we want to group elementary
// geometrical entities into more meaningful groups, e.g. to define some
// mathematical ("domain", "boundary"), functional ("left wing", "fuselage") or
// material ("steel", "carbon") properties.
//
// Such groups are called "Physical Groups" in Gmsh. By default, if physical
// groups are defined, Gmsh will export in output files only mesh elements that
// belong to at least one physical group. (To force Gmsh to save all elements,
// whether they belong to physical groups or not, set 'Mesh.SaveAll=1;', or
// specify '-save_all' on the command line.) Physical groups are also identified
// by tags, i.e. strictly positive integers, that should be unique per dimension
// (0D, 1D, 2D or 3D). Physical groups can also be given names.
//
// Here we define a physical curve that groups the left, bottom and right curves
// in a single group (with prescribed tag 5); and a physical surface with name
// "My surface" (with an automatic tag) containing the geometrical surface 1:

Physical Curve(5) = {1, 2, 4};
Physical Surface("My surface") = {1};

// Now that the geometry is complete, you can
// - either open this file with Gmsh and select '2D' in the 'Mesh' module to
// create a mesh; then select 'Save' to save it to disk in the default format
// (or use 'File->Export' to export in other formats);
// - or run 'gmsh t1.geo -2' to mesh in batch mode on the command line.

// You could also uncomment the following lines in this script:
//
// Mesh 2;
// Save "t1.msh";
//
// which would lead Gmsh to mesh and save the mesh every time the file is
// parsed. (To simply parse the file from the command line, you can use 'gmsh
// t1.geo -')

// By default, Gmsh saves meshes in the latest version of the Gmsh mesh file
// format (the 'MSH' format). You can save meshes in other mesh formats by
// specifying a filename with a different extension in the GUI, on the command
// line or in scripts. For example
//
// Save "t1.unv";
//
// will save the mesh in the UNV format. You can also save the mesh in older
// versions of the MSH format:
//
// - In the GUI: open 'File->Export', enter your 'filename.msh' and then pick
//   the version in the dropdown menu.
// 2.2 t2: Transformations, extruded geometries, volumes

See t2.geo. Also available in C++ (t2.cpp), C (t2.c), Python (t2.py), Julia (t2.jl) and Fortran (t2.f90).

// We first include the previous tutorial file, in order to use it as a basis
// for this one. Including a file is equivalent to copy-pasting its contents:
Include "t1.geo";

// We can then add new points and curves in the same way as we did in 't1.geo':
Point(5) = {0, .4, 0, lc};
Line(5) = {4, 5};

// Gmsh also provides tools to transform (translate, rotate, etc.)
// elementary entities or copies of elementary entities. For example, point
// 5 can be moved by 0.02 to the left with:
Translate {-0.02, 0, 0} { Point{5}; }

// And it can be further rotated by -Pi/4 around (0, 0.3, 0) (with the rotation
// along the z axis) with:
Rotate {{0,0,1}, {0,0.3,0}, -Pi/4} { Point{5}; }

// Note that there are no units in Gmsh: coordinates are just numbers - it’s up
// to the user to associate a meaning to them.

// Point 3 can be duplicated and translated by 0.05 along the y axis:
Translate {0, 0.05, 0} { Duplicata{ Point{3}; } }

// This command created a new point with an automatically assigned tag. This tag
// can be obtained using the graphical user interface by hovering the mouse over
// the point: in this case, the new point has tag '6'.

Line(7) = {3, 6};
Line(8) = {6, 5};
Curve Loop(10) = {5,-8,-7,3};
Plane Surface(11) = {10};

// To automate the workflow, instead of using the graphical user interface to
// obtain the tags of newly created entities, one can use the return value of
// the transformation commands directly. For example, the 'Translate' command
// returns a list containing the tags of the translated entities. Let's
// translate copies of the two surfaces 1 and 11 to the right with the following
// command:

my_new_surfs[] = Translate {0.12, 0, 0} { Duplicata{ Surface{1, 11}; } }

// my_new_surfs[] (note the square brackets, and the ';' at the end of the
// command) denotes a list, which contains the tags of the two new surfaces
// (check 'Tools->Message console' to see the message):

Printf("New surfaces '%g' and '%g', my_new_surfs[0], my_new_surfs[1]);

// In Gmsh lists use square brackets for their definition (mylist[] = {1, 2,
// 3};) as well as to access their elements (myotherlist[] = {mylist[0],
// mylist[2]}; mythirdlist[] = myotherlist[];), with list indexing starting at
// 0. To get the size of a list, use the hash (pound): len = #mylist[].
//
// Note that parentheses can also be used instead of square brackets, so that we could also write 'myfourthlist() = {mylist(0), mylist(1)};'.

// Volumes are the fourth type of elementary entities in Gmsh. In the same way one defines curve loops to build surfaces, one has to define surface loops (i.e. 'shells') to build volumes. The following volume does not have holes and thus consists of a single surface loop:

Point(100) = {0., 0.3, 0.12, lc}; Point(101) = {0.1, 0.3, 0.12, lc};
Point(102) = {0.1, 0.35, 0.12, lc};

xyz[] = Point{5}; // Get coordinates of point 5
Point(103) = {xyz[0], xyz[1], 0.12, lc};

Line(110) = {4, 100}; Line(111) = {3, 101};
Line(112) = {6, 102}; Line(113) = {5, 103};
Line(114) = {103, 100}; Line(115) = {100, 101};
Line(116) = {101, 102}; Line(117) = {102, 103};

Curve Loop(118) = {115, -111, 3, 110}; Plane Surface(119) = {118};
Curve Loop(120) = {111, 116, -112, -7}; Plane Surface(121) = {120};
Curve Loop(122) = {112, 117, -113, -8}; Plane Surface(123) = {122};
Curve Loop(124) = {114, -110, 5, 113}; Plane Surface(125) = {124};
Curve Loop(126) = {115, 116, 117, 114}; Plane Surface(127) = {126};

Surface Loop(128) = {127, 119, 121, 123, 125, 11}; Volume(129) = {128};

// When a volume can be extruded from a surface, it is usually easier to use the 'Extrude' command directly instead of creating all the points, curves and surfaces by hand. For example, the following command extrudes the surface 11 along the z axis and automatically creates a new volume (as well as all the needed points, curves and surfaces):

Extrude {0, 0, 0.12} { Surface{my_new_surfs[1]}; } // The following command permits to manually assign a mesh size to some of the new points:
MeshSize {103, 105, 109, 102, 28, 24, 6, 5} = lc * 3;

// We finally group volumes 129 and 130 in a single physical group with tag '1' and name "The volume":
Physical Volume("The volume", 1) = {129,130};

// Note that, if the transformation tools are handy to create complex geometries, it is also sometimes useful to generate the 'flat' geometry, with an explicit representation of all the elementary entities.
// With the built-in geometry kernel, this can be achieved with 'File->Export' by // selecting the 'Gmsh Unrolled GEO' format, or by adding // // Save "file.geo_unrolled"; // // in the script. It can also be achieved with 'gmsh t2.geo -0' on the command // line. // // With the OpenCASCADE geometry kernel, unrolling the geometry can be achieved // with 'File->Export' by selecting the 'OpenCASCADE BRep' format, or by adding // // Save "file.brep"; // // in the script. (OpenCASCADE geometries can also be exported to STEP.)

// It is important to note that Gmsh never translates geometry data into a // common representation: all the operations on a geometrical entity are // performed natively with the associated geometry kernel. Consequently, one // cannot export a geometry constructed with the built-in kernel as an // OpenCASCADE BRep file; or export an OpenCASCADE model as an Unrolled GEO // file.

2.3 t3: Extruded meshes, ONELAB parameters, options

See t3.geo. Also available in C++ (t3.cpp), Python (t3.py), Julia (t3.jl) and Fortran (t3.f90).

// Again, we start by including the first tutorial:

Include "t1.geo";

// As in 't2.geo', we plan to perform an extrusion along the z axis. But here, // instead of only extruding the geometry, we also want to extrude the 2D // mesh. This is done with the same 'Extrude' command, but by specifying element // 'Layers' (2 layers in this case, the first one with 8 subdivisions and the
// second one with 2 subdivisions, both with a height of h/2):

h = 0.1;

Extrude {0,0,h} {
    Surface(1); Layers{ {8,2}, {0.5,1} }; }

// The extrusion can also be performed with a rotation instead of a translation,
// and the resulting mesh can be recombined into prisms (we use only one layer
// here, with 7 subdivisions). All rotations are specified by an axis direction
// ({{0,1,0}}, an axis point ({-0.1,0,0.1}) and a rotation angle (-Pi/2):

Extrude { {0,1,0} , {-0.1,0,0.1} , -Pi/2 } {
    Surface(28); Layers(7); Recombine;
}

// Using the built-in geometry kernel, only rotations with angles < Pi are
// supported. To do a full turn, you will thus need to apply at least 3
// rotations. The OpenCASCADE geometry kernel does not have this limitation.

// Note that a translation ({{-2*h,0,0}}) and a rotation ({{1,0,0}, {0,0.15,0.25},
// Pi/2}) can also be combined to form a "twist". Here the angle is specified as
// a ONELAB parameter, using the 'DefineConstant' syntax. ONELAB parameters can
// be modified interactively in the GUI, and can be exchanged with other codes
// connected to the same ONELAB database:

DefineConstant[ angle = {90, Min 0, Max 120, Step 1,
    Name "Parameters/Twisting angle"} ];

// In more details, 'DefineConstant' allows you to assign the value of the
// ONELAB parameter "Parameters/Twisting angle" to the variable 'angle'. If the
// ONELAB parameter does not exist in the database, 'DefineConstant' will create
// it and assign the default value '90'. Moreover, if the variable 'angle' was
// defined before the call to 'DefineConstant', the 'DefineConstant' call would
// simply be skipped. This allows to build generic parametric models, whose
// parameters can be frozen from the outside - the parameters ceasing to be
// "parameters".

// An interesting use of this feature is in conjunction with the '-setnumber
// name value' command line switch, which defines a variable 'name' with value
// 'value'. Calling ‘gmsh t3.geo -setnumber angle 30’ would define 'angle'
// before the 'DefineConstant', making 't3.geo' non-parametric
// ("Parameters/Twisting angle" will not be created in the ONELAB database and
// will not be available for modification in the graphical user interface).

out[] = Extrude { {-2*h,0,0}, {1,0,0} , {0,0.15,0.25} , angle * Pi / 180 } {
    Surface(50); Layers(10); Recombine;
};

// In this last extrusion command we retrieved the volume number
// programmatically by using the return value (a list) of the 'Extrude'
// command. This list contains the "top" of the extruded surface (in ‘out[0]’),
// the newly created volume (in ‘out[1]’) and the tags of the lateral surfaces
// (in ‘out[2]’, ‘out[3]’, ...).

// We can then define a new physical volume (with tag 101) to group all the
// elementary volumes:

Physical Volume(101) = {1, 2, out[1]};

// Let us now change some options... Since all interactive options are
// accessible in Gmsh's scripting language, we can for example make point tags
// visible or redefine some colors directly in the input file:

Geometry.PointNumbers = 1;
Geometry.Color.Points = Orange;
General.Color.Text = White;
Mesh.Color.Points = {255, 0, 0};

// Note that all colors can be defined literally or numerically, i.e.
// ‘Mesh.Color.Points = Red’ is equivalent to ‘Mesh.Color.Points = {255,0,0}’;
// and also note that, as with user-defined variables, the options can be used
// either as right or left hand sides, so that the following command will set
// the surface color to the same color as the points:

// You can use the ‘Help->Current Options and Workspace’ menu to see the current
// values of all options. To save all the options in a file, use
// ‘File->Export->Gmsh Options’. To associate the current options with the
// current file use ‘File->Save Model Options’. To save the current options for
// all future Gmsh sessions use ‘File->Save Options As Default’.

2.4 t4: Built-in functions, holes in surfaces, annotations, entity colors

See t4.geo. Also available in C++ (t4.cpp), Python (t4.py), Julia (t4.jl) and Fortran (t4.f90).
As usual, we start by defining some variables:

cm = 1e-02;
e1 = 4.5 * cm; e2 = 6 * cm / 2; e3 = 5 * cm / 2;
h1 = 5 * cm; h2 = 10 * cm; h3 = 5 * cm; h4 = 2 * cm; h5 = 4.5 * cm;
R1 = 1 * cm; R2 = 1.5 * cm; r = 1 * cm;
Lc1 = 0.01;
Lc2 = 0.003;

We can use all the usual mathematical functions (note the capitalized first
letters), plus some useful functions like Hypot(a, b) := \( \sqrt{a^2 + b^2} \):

\[
ccos = \frac{-h5*R1 + e2 * \text{Hypot}(h5, \text{Hypot}(e2, R1))}{(h5^2 + e2^2)};
\]
\[
ssin = \sqrt{1 - ccos^2};
\]

Then we define some points and some lines using these variables:

Point(1) = {-e1-e2, 0 , 0, Lc1}; Point(2) = {-e1-e2, h1 , 0, Lc1};
Point(3) = {-e3-r , h1 , 0, Lc2}; Point(4) = {-e3-r , h1+r , 0, Lc2};
Point(5) = {-e3 , h1+r , 0, Lc2}; Point(6) = {-e3 , h1+h2, 0, Lc1};
Point(7) = { e3 , h1+h2, 0, Lc1}; Point(8) = { e3 , h1+r , 0, Lc2};
Point(9) = { e3+r , h1+r , 0, Lc2}; Point(10) = { e3+r , h1 , 0, Lc2};
Point(11) = { e1+e2, h1 , 0, Lc1}; Point(12) = { e1+e2, 0 , 0, Lc1};
Point(13) = { e2 , 0 , 0, Lc1};
Point(14) = { R1 / ssin, h5+R1*ccos, 0, Lc2};
Point(15) = { 0 , h5 , 0, Lc2};
Point(16) = {-R1 / ssin, h5+R1*ccos, 0, Lc2};
Point(17) = { -e2 , 0.0 , 0, Lc1};
Point(18) = {-R2 , h1+h3 , 0, Lc2}; Point(19) = {-R2 , h1+h3+h4, 0, Lc2};
Point(20) = { 0 , h1+h3+h4, 0, Lc2}; Point(21) = { R2 , h1+h3+h4, 0, Lc2};
Point(22) = { R2 , h1+h3 , 0, Lc2}; Point(23) = { 0 , h1+h3 , 0, Lc2};
Point(24) = { 0, h1+h3+h4+R2, 0, Lc2}; Point(25) = { 0, h1+h3-R2, 0, Lc2};

Line(1) = {1 , 17};
Line(2) = {17, 16};

Gmsh provides other curve primitives than straight lines: splines, B-splines,
circle arcs, ellipse arcs, etc. Here we define a new circle arc, starting at
point 14 and ending at point 16, with the circle's center being the point 15:

Circle(3) = {14,15,16};

Note that, in Gmsh, circle arcs should always be smaller than Pi. The
OpenCASCADE geometry kernel does not have this limitation.

We can then define additional lines and circles, as well as a new surface:
Line(4) = {14, 13}; Line(5) = {13, 12}; Line(6) = {12, 11};
Line(7) = {11, 10}; Circle(8) = {8, 9, 10}; Line(9) = {8, 7};
Line(10) = {7, 6}; Line(11) = {6, 5}; Circle(12) = {3, 4, 5};
Line(13) = {3, 2}; Line(14) = {2, 1}; Line(15) = {18, 19};
Circle(16) = {21, 20, 24}; Circle(17) = {24, 20, 19};
Circle(18) = {18, 23, 25}; Circle(19) = {25, 23, 22};
Line(20) = {21, 22};

Curve Loop(21) = {17, -15, 18, 19, -20, 16};
Plane Surface(22) = {21};

// But we still need to define the exterior surface. Since this surface has a
// hole, its definition now requires two curve loops:

Curve Loop(23) = {11, -12, 13, 14, 1, 2, -3, 4, 5, 6, 7, -8, 9, 10};
Plane Surface(24) = {23, 21};

// As a general rule, if a surface has N holes, it is defined by N+1 curve loops:
// the first loop defines the exterior boundary; the other loops define the
// boundaries of the holes.

// Finally, we can add some comments by embedding a post-processing view
// containing some strings:

View "comments" {
    // Add a text string in window coordinates, 10 pixels from the left and 10
    // pixels from the bottom, using the 'StrCat' function to concatenate strings:
    T2(10, -10, 0){ StrCat("Created on ", Today, " with Gmsh") ];

    // Add a text string in model coordinates centered at (X,Y,Z) = (0, 0.11, 0):
    T3(0, 0.11, 0, TextAttributes("Align", "Center", "Font", "Helvetica")){
        "Hole"
    };

    // If a string starts with 'file://', the rest is interpreted as an image
    // file. For 3D annotations, the size in model coordinates can be specified
    // after a '0' symbol in the form 'widthxheight' (if one of 'width' or
    // 'height' is zero, natural scaling is used; if both are zero, original image
    // dimensions in pixels are used):
    T3(0, 0.09, 0, TextAttributes("Align", "Center")){
        "file://t4_image.png@0.01x0"
    };

    // The 3D orientation of the image can be specified by proving the direction
    // of the bottom and left edge of the image in model space:
    T3(-0.01, 0.09, 0, 0){ "file://t4_image.png@0.01x0,0,0,1,0,1,0" ];

    // The image can also be drawn in "billboard" mode, i.e. always parallel to
    // the camera, by using the '#' symbol:
    T3(0, 0.12, 0, TextAttributes("Align", "Center")){
        "file://t4_image.png@0.01x0#"
2.5 t5: Mesh sizes, macros, loops, holes in volumes

See t5.geo. Also available in C++ (t5.cpp), Python (t5.py), Julia (t5.jl) and Fortran (t5.f90).
lcar2 = .0005;
lcar3 = .055;

// If we wanted to change these mesh sizes globally (without changing the above // definitions), we could give a global scaling factor for all mesh sizes on the // command line with the '-clscale' option (or with 'Mesh.MeshSizeFactor' in an // option file). For example, with:
//
// > gmsh t5.geo -clscale 1
//
// this input file produces a mesh of approximately 3000 nodes and 14,000 // tetrahedra. With
//
// > gmsh t5.geo -clscale 0.2
//
// the mesh counts approximately 231,000 nodes and 1,360,000 tetrahedra. You can // check mesh statistics in the graphical user interface with the // 'Tools->Statistics' menu.
//
// See 't10.geo' for more information about mesh sizes.

// We proceed by defining some elementary entities describing a truncated cube:

Point(1) = {0.5,0.5,0.5,lcar2}; Point(2) = {0.5,0.5,0,lcar1};
Point(3) = {0,0.5,0.5,lcar1}; Point(4) = {0,0,0.5,lcar1};
Point(5) = {0.5,0,0.5,lcar1}; Point(6) = {0.5,0,0,lcar1};
Point(7) = {0,0.5,0,lcar1}; Point(8) = {0,1,0,lcar1};
Point(9) = {1,1,0,lcar1}; Point(10) = {0,0,1,lcar1};
Point(11) = {0,1,1,lcar1}; Point(12) = {1,1,1,lcar1};
Point(13) = {1,0,1,lcar1}; Point(14) = {1,0,0,lcar1};

Line(1) = {8,9}; Line(2) = {9,12}; Line(3) = {12,11};
Line(4) = {11,8}; Line(5) = {9,14}; Line(6) = {14,13};
Line(7) = {13,12}; Line(8) = {11,10}; Line(9) = {10,13};
Line(10) = {10,4}; Line(11) = {4,5}; Line(12) = {5,6};
Line(13) = {6,2}; Line(14) = {2,1}; Line(15) = {1,3};
Line(16) = {3,7}; Line(17) = {7,2}; Line(18) = {3,4};
Line(19) = {5,1}; Line(20) = {7,8}; Line(21) = {6,14};

Curve Loop(22) = {-11,-19,-15,-18}; Plane Surface(23) = {22};
Curve Loop(24) = {16,17,14,15}; Plane Surface(25) = {24};
Curve Loop(26) = {-17,20,1,5,-21,13}; Plane Surface(27) = {26};
Curve Loop(28) = {-4,-1,-2,-3}; Plane Surface(29) = {28};
Curve Loop(30) = {-7,2,-5,-6}; Plane Surface(31) = {30};
Curve Loop(32) = {6,-9,10,11,12,21}; Plane Surface(33) = {32};
Curve Loop(34) = {7,3,8,9}; Plane Surface(35) = {34};
Curve Loop(36) = {-10,18,-16,-20,4,-8}; Plane Surface(37) = {36};
Curve Loop(38) = {-14,-13,-12,19}; Plane Surface(39) = {38};

// Instead of using included files, we now use a user-defined macro in order // to carve some holes in the cube:
Macro CheeseHole

// In the following commands we use the reserved variable name 'newp', which
// automatically selects a new point tag. Analogously to 'newp', the special
// variables 'newc', 'newcl, 'news', 'newsl' and 'newv' select new curve,
// curve loop, surface, surface loop and volume tags.

// If 'Geometry.OldNewReg' is set to 0, the new tags are chosen as the highest
// current tag for each category (points, curves, curve loops, ...), plus
// one. By default, for backward compatibility, 'Geometry.OldNewReg' is set
// to 1, and only two categories are used: one for points and one for the
// rest.

p1 = newp; Point(p1) = {x, y, z, 1car3};
p2 = newp; Point(p2) = {x+r,y, z, 1car3};
p3 = newp; Point(p3) = {x, y+r,z, 1car3};
p4 = newp; Point(p4) = {x, y, z+r,1car3};
p5 = newp; Point(p5) = {x-r,y, z, 1car3};
p6 = newp; Point(p6) = {x, y-r,z, 1car3};
p7 = newp; Point(p7) = {x, y, z-r,lcar3};
c1 = newc; Circle(c1) = {p2,p1,p7}; c2 = newc; Circle(c2) = {p7,p1,p5};
c3 = newc; Circle(c3) = {p5,p1,p4}; c4 = newc; Circle(c4) = {p4,p1,p2};
c5 = newc; Circle(c5) = {p2,p1,p3}; c6 = newc; Circle(c6) = {p3,p1,p5};
c7 = newc; Circle(c7) = {p5,p1,p6}; c8 = newc; Circle(c8) = {p6,p1,p2};
c9 = newc; Circle(c9) = {p7,p1,p3}; c10 = newc; Circle(c10) = {p3,p1,p4};
c11 = newc; Circle(c11) = {p4,p1,p6}; c12 = newc; Circle(c12) = {p6,p1,p7};

// We need non-plane surfaces to define the spherical holes. Here we use
// 'Surface', which can be used for surfaces with 3 or 4 curves on their
// boundary. With the he built-in kernel, if the curves are circle arcs, ruled
// surfaces are created; otherwise transfinite interpolation is used.

l1 = newcl; Curve Loop(l1) = {c5,c10,c4};
l2 = newcl; Curve Loop(l2) = {c9,-c5,c1};
l3 = newcl; Curve Loop(l3) = {c12,-c8,-c1};
l4 = newcl; Curve Loop(l4) = {c8,-c4,c11};
l5 = newcl; Curve Loop(l5) = {-c10,c6,c3};
l6 = newcl; Curve Loop(l6) = {-c11,-c3,c7};
l7 = newcl; Curve Loop(l7) = {-c2,-c7,-c12};
l8 = newcl; Curve Loop(l8) = {-c6,-c9,c2};
s1 = news; Surface(s1) = {l1};
s2 = news; Surface(s2) = {l2};
s3 = news; Surface(s3) = {l3};
s4 = news; Surface(s4) = {l4};
s5 = news; Surface(s5) = {l5};
s6 = news; Surface(s6) = {16};
s7 = news; Surface(s7) = {17};
s8 = news; Surface(s8) = {18};

// We then store the surface loops tags in a list for later reference (we will
// need these to define the final volume):

theloops[t] = newsl;
Surface Loop(theloops[t]) = {s1, s2, s3, s4, s5, s6, s7, s8};

thehole = newv;
Volume(thehole) = theloops[t];

Return

// We can use a ‘For’ loop to generate five holes in the cube:

x = 0; y = 0.75; z = 0; r = 0.09;

For t In {1:5}
    x += 0.166;
    z += 0.166;

    // We call the ‘CheeseHole’ macro:

    Call CheeseHole;

    // We define a physical volume for each hole:

    Physical Volume (t) = thehole;

    // We also print some variables on the terminal (note that, since all
    // variables in ‘.geo’ files are treated internally as floating point numbers,
    // the format string should only contain valid floating point format
    // specifiers like ‘%g’, ‘%f’, ‘%e’, etc.):

    Printf("Hole %g (center = {%g,%g,%g}, radius = %g) has number %g!",
            t, x, y, z, r, thehole);

EndFor

// We can then define the surface loop for the exterior surface of the cube:

theloops[0] = newreg;
Surface Loop(theloops[0]) = {23:39:2};

// The volume of the cube, without the 5 holes, is now defined by 6 surface
// loops: the first surface loop defines the exterior surface; the surface loops
// other than the first one define holes. (Again, to reference an array of
// variables, its identifier is followed by square brackets):
Volume(186) = {theloops[]};

// Note that using solid modelling with the OpenCASCADE geometry kernel, the
// same geometry could be built quite differently: see 't16.geo'.

// We finally define a physical volume for the elements discretizing the cube,
// without the holes (for which physical groups were already created in the
// 'For' loop):

Physical Volume (10) = 186;

// We could make only part of the model visible to only mesh this subset:
//
// Hide {}
// Recursive Show { Volume{129}; }
// Mesh.MeshOnlyVisible=1;

// Meshing algorithms can changed globally using options:

Mesh.Algorithm = 6; // Frontal-Delaunay for 2D meshes

// They can also be set for individual surfaces, e.g.

MeshAlgorithm Surface {31, 35} = 1; // MeshAdapt on surfaces 31 and 35

// To generate a curvilinear mesh and optimize it to produce provably valid
// curved elements (see A. Johnen, J.-F. Remacle and C. Geuzaine. Geometric
// validity of curvilinear finite elements. Journal of Computational Physics
// 233, pp. 359-372, 2013; and T. Toulorge, C. Geuzaine, J.-F. Remacle,
// J. Lambrechts. Robust untangling of curvilinear meshes. Journal of
// Computational Physics 254, pp. 8-26, 2013), you can uncomment the following
// lines:
//
// Mesh.ElementOrder = 2;
// Mesh.HighOrderOptimize = 2;

2.6 t6: Transfinite meshes, deleting entities

See t6.geo. Also available in C++ (t6.cpp), C (t6.c), Python (t6.py), Julia (t6.jl) and Fortran (t6.f90).
//
// Gmsh GEO tutorial 6
//
// Transfinite meshes, deleting entities
//
// Let's use the geometry from the first tutorial as a basis for this one:
lc = 1e-2;
Point(1) = {0, 0, 0, lc};
Point(2) = {.1, 0, 0, lc};
Point(3) = {.1, .3, 0, lc};
Point(4) = {0, .3, 0, lc};
Line(1) = {1, 2};
Line(2) = {3, 2};
Line(3) = {3, 4};
Line(4) = {4, 1};
Curve Loop(1) = {4, 1, -2, 3};
Plane Surface(1) = {1};

// Delete the surface and the left line, and replace the line with 3 new ones:
Delete{ Surface{1}; Curve{4}; }
p1 = newp; Point(p1) = {-0.05, 0.05, 0, lc};
p2 = newp; Point(p2) = {-0.05, 0.1, 0, lc};

l1 = newc; Line(l1) = {1, p1};
l2 = newc; Line(l2) = {p1, p2};
l3 = newc; Line(l3) = {p2, 4};

// Create a surface:
Curve Loop(2) = {2, -1, l1, l2, l3, -3};
Plane Surface(1) = {-2};

// The 'Transfinite Curve' meshing constraints explicitly specifies the location of the nodes on the curve. For example, the following command forces 20 uniformly placed nodes on curve 2 (including the nodes on the two end points):
Transfinite Curve{2} = 20;

// Let's put 20 points total on combination of curves 'l1', 'l2' and 'l3' (beware that the points 'p1' and 'p2' are shared by the curves, so we do not create 6 + 6 + 10 = 22 nodes, but 20!)
Transfinite Curve{l1} = 6;
Transfinite Curve{l2} = 6;
Transfinite Curve{l3} = 10;

// Finally, we put 30 nodes following a geometric progression on curve 1 (reversed) and on curve 3:
Transfinite Curve{-1, 3} = 30 Using Progression 1.2;

// The 'Transfinite Surface' meshing constraint uses a transfinite interpolation
algorithm in the parametric plane of the surface to connect the nodes on the boundary using a structured grid. If the surface has more than 4 corner points, the corners of the transfinite interpolation have to be specified by hand:

\[
\text{Transfinite Surface}(1) = \{1, 2, 3, 4\};
\]

To create quadrangles instead of triangles, one can use the 'Recombine' command:

\[
\text{Recombine Surface}(1);
\]

When the surface has only 3 or 4 points on its boundary the list of corners can be omitted in the 'Transfinite Surface' constraint:

\[
\begin{align*}
\text{Point}(7) &= \{0.2, 0.2, 0, 1.0\}; \\
\text{Point}(8) &= \{0.2, 0.1, 0, 1.0\}; \\
\text{Point}(9) &= \{-0, 0.3, 0, 1.0\}; \\
\text{Point}(10) &= \{0.25, 0.2, 0, 1.0\}; \\
\text{Point}(11) &= \{0.3, 0.1, 0, 1.0\}; \\
\text{Line}(10) &= \{8, 11\}; \\
\text{Line}(11) &= \{11, 10\}; \\
\text{Line}(12) &= \{10, 7\}; \\
\text{Line}(13) &= \{7, 8\}; \\
\text{Curve Loop}(14) &= \{13, 10, 11, 12\}; \\
\text{Plane Surface}(15) &= \{14\}; \\
\text{Transfinite Curve }\{10:13\} &= 10; \\
\text{Transfinite Surface}(15);
\end{align*}
\]

The way triangles are generated can be controlled by appending "Left", "Right" or "Alternate" after the 'Transfinite Surface' command. Try e.g.

\[
\text{Transfinite Surface}(15) \text{ Alternate;}
\]

Finally we apply an elliptic smoother to the grid to have a more regular mesh:

\[
\text{Mesh.Smoothing} = 100;
\]

2.7 t7: Background meshes

See t7.geo. Also available in C++ (t7.cpp), Python (t7.py), Julia (t7.jl) and Fortran (t7.f90).
Background meshes

Mesh sizes can be specified very accurately by providing a background mesh, i.e., a post-processing view that contains the target mesh sizes.

Merge a list-based post-processing view containing the target mesh sizes:
Merge "t7_bgmesh.pos";

If the post-processing view was model-based instead of list-based (i.e. if it was based on an actual mesh), we would need to create a new model to contain the geometry so that meshing it does not destroy the background mesh. It's not necessary here since the view is list-based, but it does no harm:
NewModel;

Merge the first tutorial geometry:
Merge "t1.geo";

Apply the view as the current background mesh size field:
Background Mesh View[0];

In order to compute the mesh sizes from the background mesh only, and disregard any other size constraints, one can set:
Mesh.MeshSizeExtendFromBoundary = 0;
Mesh.MeshSizeFromPoints = 0;
Mesh.MeshSizeFromCurvature = 0;

See 't10.geo' for additional information: background meshes are actually a particular case of general "mesh size fields".

2.8 t8: Post-processing, image export and animations

See t8.geo. Also available in C++ (t8.cpp), Python (t8.py), Julia (t8.jl) and Fortran (t8.f90).
// In addition to creating geometries and meshes, GEO scripts can also be used
// to manipulate post-processing datasets (called "views" in Gmsh).

// We first include 't1.geo' as well as some post-processing views:
Include "t1.geo";
Include "view1.pos";
Include "view1.pos";
Include "view4.pos";

// Gmsh can read post-processing views in various formats. Here the 'view1.pos'
// and 'view4.pos' files are in the Gmsh "parsed" format, which is interpreted
// directly by the GEO script parser. The parsed format should only be used for
// relatively small datasets of course: for larger datasets using e.g. MSH files
// is much more efficient.

// We then set some general options:
General.Trackball = 0;
General.RotationX = 0; General.RotationY = 0; General.RotationZ = 0;
General.Color.Text = Black;
General.Orthographic = 0;
General.Axes = 0; General.SmallAxes = 0;

// We also set some options for each post-processing view:
v0 = PostProcessing.NbViews-4;
v1 = v0+1; v2 = v0+2; v3 = v0+3;

View[v0].IntervalsType = 2;
View[v0].OffsetZ = 0.05;
View[v0].RaiseZ = 0;
View[v0].Light = 1;
View[v0].ShowScale = 0;
View[v0].SmoothNormals = 1;

View[v1].IntervalsType = 1;
View[v1].ColorTable = { Green, Blue };
View[v1].NbIso = 10;
View[v1].ShowScale = 0;

View[v2].Name = "Test...";
View[v2].Axes = 1;
View[v2].Color.Axes = Black;
View[v2].IntervalsType = 2;
View[v2].Type = 2;
View[v2].AutoPosition = 0;
View[v2].PositionX = 85;
View[v2].PositionY = 50;
View[v2].Width = 200;
View[v2].Height = 130;

View[v3].Visible = 0;

// You can save an MPEG movie directly by selecting ‘File->Export’ in the
// GUI. Several predefined animations are setup, for looping on all the time
// steps in views, or for looping between views.

// But a script can be used to build much more complex animations, by changing
// options at run-time and re-rendering the graphics. Each frame can then be
// saved to disk as an image, and multiple frames can be encoded to form a
// movie. Below is an example of such a custom animation.

t = 0; // Initial step

// Loop on num from 1 to 3
For num In {1:3}

    View[v0].TimeStep = t; // Set time step
    View[v1].TimeStep = t;
    View[v2].TimeStep = t;
    View[v3].TimeStep = t;

    t = (View[v0].TimeStep < View[v0].NbTimeStep-1) ? t+1 : 0; // Increment

    View[v0].RaiseZ += 0.01/View[v0].Max * t; // Raise view v0

    If (num == 3)
        // Resize the graphics when num == 3, to create 640x480 frames
        General.GraphicsHeight = 480;
    EndIf

frames = 50;

// Loop on num2 from 1 to frames
For num2 In {1:frames}

    // Incrementally rotate the scene
    General.RotationX += 10;
    General.RotationY = General.RotationX / 3;
    General.RotationZ += 0.1;

    // Sleep for 0.01 second
    Sleep 0.01;

    // Draw the scene (one could use ‘DrawForceChanged’ instead to force the
    // reconstruction of the vertex arrays, e.g. if changing element clipping)
    Draw;
If (num == 3)
    // Uncomment the following lines to save each frame to an image file (the
    // 'Print' command saves the graphical window; the 'Sprintf' function
    // permits to create the file names on the fly):
    // Print Sprintf("t8-%g.gif", num2);
    // Print Sprintf("t8-%g.ppm", num2);
    // Print Sprintf("t8-%g.jpg", num2);
EndIf
EndFor

If(num == 3)
    // Here we could make a system call to generate a movie. For example, with
    // ffmpeg:
    // System "ffmpeg -i t8-%d.jpg t8.mpg"
EndIf
EndFor

2.9 t9: Plugins

See t9.geo. Also available in C++ (t9.cpp), Python (t9.py), Julia (t9.jl) and Fortran (t9.f90).
// Let us for example include a three-dimensional scalar view:

Include "view3.pos" ;

// We then set some options for the 'Isosurface' plugin (which extracts an
// isosurface from a 3D scalar view), and run it:

Plugin(Isosurface).Value = 0.67 ; // Iso-value level
Plugin(Isosurface).View = 0 ; // Source view is View[0]
Plugin(Isosurface).Run ; // Run the plugin!

// We also set some options for the 'CutPlane' plugin (which computes a section
// of a 3D view using the plane A*x+B*y+C*z+D=0), and then run it:

Plugin(CutPlane).A = 0 ;
Plugin(CutPlane).B = 0.2 ;
Plugin(CutPlane).C = 1 ;
Plugin(CutPlane).D = 0 ;
Plugin(CutPlane).View = 0 ;
Plugin(CutPlane).Run ;

// Add a title (By convention, for window coordinates a value greater than 99999
// represents the center. We could also use 'General.GraphicsWidth / 2', but
// that would only center the string for the current window size.):

Plugin(Annotate).Text = "A nice title" ;
Plugin(Annotate).X = 1.e5;
Plugin(Annotate).Y = 50 ;
Plugin(Annotate).Font = "Times-BoldItalic" ;
Plugin(Annotate).FontSize = 28 ;
Plugin(Annotate).Align = "Center" ;
Plugin(Annotate).View = 0 ;
Plugin(Annotate).Run ;

Plugin(Annotate).Text = "(and a small subtitle)" ;
Plugin(Annotate).Y = 70 ;
Plugin(Annotate).Font = "Times-Roman" ;
Plugin(Annotate).FontSize = 12 ;
Plugin(Annotate).Run ;

// We finish by setting some options:

View[0].Light = 1;
View[0].IntervalsType = 1;
View[0].NbIso = 6;
View[0].SmoothNormals = 1;
View[1].IntervalsType = 2;
View[2].IntervalsType = 2;
2.10 t10: Mesh size fields

See t10.geo. Also available in C++ (t10.cpp), Python (t10.py), Julia (t10.jl) and Fortran (t10.f90).

```cpp
// In addition to specifying target mesh sizes at the points of the geometry
// (see ‘t1.geo’) or using a background mesh (see ‘t7.geo’), you can use general
// mesh size "Fields".

// Let's create a simple rectangular geometry
lc = .15;
Point(1) = {0.0,0.0,0,lc}; Point(2) = {1,0.0,0,lc};
Point(3) = {1,1,0,lc}; Point(4) = {0,1,0,lc};
Point(5) = {0.2,.5,0,lc};

Line(1) = {1,2}; Line(2) = {2,3}; Line(3) = {3,4}; Line(4) = {4,1};
Curve Loop(5) = {1,2,3,4}; Plane Surface(6) = {5};

// Say we would like to obtain mesh elements with size lc/30 near curve 2 and
// point 5, and size lc elsewhere. To achieve this, we can use two fields:
// "Distance", and "Threshold". We first define a Distance field (‘Field[1]’) on
// points 5 and on curve 2. This field returns the distance to point 5 and to
// (100 equidistant points on) curve 2.
Field[1] = Distance;
Field[1].PointsList = {5};
Field[1].CurvesList = {2};
Field[1].Sampling = 100;

// We then define a ‘Threshold’ field, which uses the return value of the
// ‘Distance’ field 1 in order to define a simple change in element size
// depending on the computed distances
```

```cpp
// In addition to specifying target mesh sizes at the points of the geometry
// (see ‘t1.geo’) or using a background mesh (see ‘t7.geo’), you can use general
// mesh size "Fields".

// Let's create a simple rectangular geometry

Field[1].CurvesList = {2};
Field[1].Sampling = 100;
```
// SizeMax -------------------------
// /                             /
// /                             /
// SizeMin ----------------------
// | | |
// Point DistMin DistMax
Field[2] = Threshold;
Field[2].InField = 1;
Field[2].SizeMin = lc / 30;
Field[2].SizeMax = lc;
Field[2].DistMin = 0.15;
Field[2].DistMax = 0.5;

// Say we want to modulate the mesh element sizes using a mathematical function
// of the spatial coordinates. We can do this with the MathEval field:
Field[3].F = "\cos(4*3.14*x) \ast \sin(4*3.14*y) / 10 + 0.101";

// We could also combine MathEval with values coming from other fields. For
// example, let's define a 'Distance' field around point 1
Field[4] = Distance;
Field[4].PointsList = {1};

// We can then create a 'MathEval' field with a function that depends on the
// return value of the 'Distance' field 4, i.e., depending on the distance to
// point 1 (here using a cubic law, with minimum element size = lc / 100)
Field[5].F = Sprintf("F4^3 + %g", lc / 100);

// We could also use a 'Box' field to impose a step change in element sizes
// inside a box
Field[6] = Box;
Field[6].VIn = lc / 15;
Field[6].VOut = lc;
Field[6].XMin = 0.3;
Field[6].XMax = 0.6;
Field[6].YMin = 0.3;
Field[6].YMax = 0.6;
Field[6].Thickness = 0.3;

// Many other types of fields are available: see the reference manual for a
// complete list. You can also create fields directly in the graphical user
// interface by selecting 'Define->Size fields' in the 'Mesh' module.

// Let's use the minimum of all the fields as the background mesh size field
Field[7] = Min;
Field[7].FieldsList = {2, 3, 5, 6};
Background Field = 7;

// To determine the size of mesh elements, Gmsh locally computes the minimum of
1) the size of the model bounding box;
2) if \( \text{Mesh.MeshSizeFromPoints} \) is set, the mesh size specified at geometrical points;
3) if \( \text{Mesh.MeshSizeFromCurvature} \) is positive, the mesh size based on curvature (the value specifying the number of elements per \( 2 \times \pi \) rad);
4) the background mesh size field;
5) any per-entity mesh size constraint.

This value is then constrained in the interval \([\text{Mesh.MeshSizeMin}, \text{Mesh.MeshSizeMax}]\) and multiplied by \( \text{Mesh.MeshSizeFactor} \). In addition, boundary mesh sizes are interpolated inside surfaces and/or volumes depending on the value of \( \text{Mesh.MeshSizeExtendFromBoundary} \) (which is set by default).

When the element size is fully specified by a mesh size field (as it is in this example), it is thus often desirable to set

\[
\text{Mesh.MeshSizeExtendFromBoundary} = 0;
\text{Mesh.MeshSizeFromPoints} = 0;
\text{Mesh.MeshSizeFromCurvature} = 0;
\]

This will prevent over-refinement due to small mesh sizes on the boundary.

Finally, while the default "Frontal-Delaunay" 2D meshing algorithm (\( \text{Mesh.Algorithm} = 6 \)) usually leads to the highest quality meshes, the "Delaunay" algorithm (\( \text{Mesh.Algorithm} = 5 \)) will handle complex mesh size fields better - in particular size fields with large element size gradients:

\[
\text{Mesh.Algorithm} = 5;
\]

### 2.11 t11: Unstructured quadrangular meshes

See t11.geo. Also available in C++ (t11.cpp), Python (t11.py), Julia (t11.jl) and Fortran (t11.f90).

---

// Gmsh GEO tutorial 11
// Unstructured quadrangular meshes
//
// Gmsh GEO tutorial 11
// Unstructured quadrangular meshes
//
-- We have seen in tutorials ‘t3.geo’ and ‘t6.geo’ that extruded and transfinite
-- meshes can be "recombined" into quads, prisms or hexahedra by using the
-- "Recombine" keyword. Unstructured meshes can be recombined in the same
-- way. Let’s define a simple geometry with an analytical mesh size field:

Point(1) = {-1.25, -.5, 0}; Point(2) = {1.25, -.5, 0};
Point(3) = {1.25, 1.25, 0}; Point(4) = {-1.25, 1.25, 0};

Line(1) = {1, 2}; Line(2) = {2, 3};
Line(3) = {3, 4}; Line(4) = {4, 1};

Curve Loop(4) = {1, 2, 3, 4}; Plane Surface(100) = {4};

Field[1] = MathEval;
Field[1].F = "0.01*(1.0+30.*(y-x*x)*(y-x*x) + (1-x)*(1-x))";
Background Field = 1;

-- To generate quadrangles instead of triangles, we can simply add

Recombine Surface{100};

-- If we’d had several surfaces, we could have used ‘Recombine Surface {;}’.
-- Yet another way would be to specify the global option "Mesh.RecombineAll =
-- 1;".

-- The default recombination algorithm is called "Blossom": it uses a minimum
-- cost perfect matching algorithm to generate fully quadrilateral meshes from
-- triangulations. More details about the algorithm can be found in the
-- following paper: J.-F. Remacle, J. Lambrechts, B. Seny, E. Marchandise,
-- A. Johnen and C. Geuzaine, "Blossom-Quad: a non-uniform quadrilateral mesh
-- generator using a minimum cost perfect matching algorithm", International

-- For even better 2D (planar) quadrilateral meshes, you can try the
-- experimental "Frontal-Delaunay for quads“ meshing algorithm, which is a
-- triangulation algorithm that enables to create right triangles almost
-- everywhere: J.-F. Remacle, F. Henrotte, T. Carrier-Baudouin, E. Bechet,
-- E. Marchandise, C. Geuzaine and T. Mouton. A frontal Delaunay quad mesh
-- generator using the L^inf norm. International Journal for Numerical Methods
-- in Engineering, 94, pp. 494-512, 2013. Uncomment the following line to try
-- the Frontal-Delaunay algorithms for quads:
--
-- Mesh.Algorithm = 8;

-- The default recombination algorithm might leave some triangles in the mesh,
-- if recombining all the triangles leads to badly shaped quads. In such cases,
-- to generate full-quad meshes, you can either subdivide the resulting hybrid
-- mesh (with Mesh.SubdivisionAlgorithm = 1), or use the full-quad recombination
-- algorithm, which will automatically perform a coarser mesh followed by
-- recombination, smoothing and subdivision. Uncomment the following line to try
-- the full-quad algorithm:
--
// Mesh.RecombinationAlgorithm = 2; // or 3

// Note that you could also apply the recombination algorithm and/or the
// subdivision step explicitly after meshing, as follows:
//
// Mesh 2;
// RecombineMesh;
// Mesh.SubdivisionAlgorithm = 1;
// RefineMesh;

2.12 t12: Cross-patch meshing with compounds

See t12.geo/ Also available in C++ (t12.cpp), Python (t12.py), Julia (t12.jl) and Fortran (t12.f90).

// "Compound" meshing constraints allow to generate meshes across surface
// boundaries, which can be useful e.g. for imported CAD models (e.g. STEP) with
// undesired small features.

// When a ‘Compound Curve’ or ‘Compound Surface’ meshing constraint is given,
// at mesh generation time Gmsh
// 1. meshes the underlying elementary geometrical entities, individually
// 2. creates a discrete entity that combines all the individual meshes
// 3. computes a discrete parametrization (i.e. a piece-wise linear mapping)
//    on this discrete entity
// 4. meshes the discrete entity using this discrete parametrization instead
//    of the underlying geometrical description of the underlying elementary
//    entities making up the compound
// 5. optionally, reclassifies the mesh elements and nodes on the original
//    entities

// Step 3. above can only be performed if the mesh resulting from the
// combination of the individual meshes can be reparametrized, i.e. if the shape
// is "simple enough". If the shape is not amenable to reparametrization, you
// should create a full mesh of the geometry and first re-classify it to
// generate patches amenable to reparametrization (see ‘t13.geo’).

// The mesh of the individual entities performed in Step 1. should usually be
// finer than the desired final mesh; this can be controlled with the
// ‘Mesh.CompoundMeshSizeFactor’ option.

// The optional reclassification on the underlying elementary entities in Step
// 5. is governed by the ‘Mesh.CompoundClassify’ option.

lc = 0.1;

Point(1) = {0, 0, 0, lc}; Point(2) = {1, 0, 0, lc};
Point(3) = {1, 1, 0.5, lc}; Point(4) = {0, 1, 0.4, lc};
Point(5) = {0.3, 0.2, 0, lc}; Point(6) = {0, 0.01, 0.01, lc};
Point(7) = {0, 0.02, 0.02, lc}; Point(8) = {1, 0.05, 0.02, lc};
Point(9) = {1, 0.32, 0.02, lc};

Line(1) = {1, 2}; Line(2) = {2, 8}; Line(3) = {8, 9};
Line(4) = {9, 3}; Line(5) = {3, 4}; Line(6) = {4, 7};
Line(7) = {7, 6}; Line(8) = {6, 1}; Spline(9) = {7, 5, 9};
Line(10) = {6, 8};

Curve Loop(11) = {5, 6, 9, 4}; Surface(1) = {11};
Curve Loop(13) = {-9, 3, 10, 7}; Surface(5) = {13};
Curve Loop(15) = {-10, 2, 1, 8}; Surface(10) = {15};

// Treat curves 2, 3 and 4 as a single curve when meshing (i.e. mesh across
// points 6 and 7)
Compound Curve{2, 3, 4};

// Idem with curves 6, 7 and 8
Compound Curve{6, 7, 8};

// Treat surfaces 1, 5 and 10 as a single surface when meshing (i.e. mesh across
// curves 9 and 10)
Compound Surface{1, 5, 10};

2.13 t13: Remeshing an STL file without an underlying CAD model

See t13.geo. Also available in C++ (t13.cpp), Python (t13.py), Julia (t13.jl) and Fortran (t13.f90).
Gmsh 4.12.0 (development version)

// Gmsh GEO tutorial 13
// Remeshing an STL file without an underlying CAD model
//
// Let's merge an STL mesh that we would like to remesh.
Merge "t13_data.stl";

// We first classify ("color") the surfaces by splitting the original surface
// along sharp geometrical features. This will create new discrete surfaces,
// curves and points.

DefineConstant[
  // Angle between two triangles above which an edge is considered as sharp
  angle = {40, Min 20, Max 120, Step 1,
    Name "Parameters/Angle for surface detection"},
  // For complex geometries, patches can be too complex, too elongated or too
  // large to be parametrized; setting the following option will force the
  // creation of patches that are amenable to reparametrization:
  forceParametrizablePatches = {0, Choices{0,1},
    Name "Parameters/Create surfaces guaranteed to be parametrizable"},
  // For open surfaces include the boundary edges in the classification process:
  includeBoundary = 1,
  // Force curves to be split on given angle:
  curveAngle = 180
];
ClassifySurfaces{angle * Pi/180, includeBoundary, forceParametrizablePatches, 
  curveAngle * Pi / 180};

// Create a geometry for all the discrete curves and surfaces in the mesh, by
// computing a parametrization for each one
CreateGeometry;

// In batch mode the two steps above can be performed with 'gmsh t13.stl
// -reparam 40', which will save 't13.msh' containing the parametrizations, and
// which can thus subsequently be remeshed.

// Note that if a CAD model (e.g. as a STEP file, see ‘t20.geo’) is available
// instead of an STL mesh, it is usually better to use that CAD model instead of
// the geometry created by reparametrizing the mesh. Indeed, CAD geometries will
// in general be more accurate, with smoother parametrizations, and will lead to
// more efficient and higher quality meshing. Discrete surface remeshing in Gmsh
// is optimized to handle dense STL meshes coming from e.g. imaging systems
// where no CAD is available; it is less well suited for the poor quality STL
// triangulations (optimized for size, with e.g. very elongated triangles) that
// are usually generated by CAD tools for e.g. 3D printing.

// Create a volume as usual
Surface Loop(1) = Surface{};

// Find bases for relative homology spaces of the domain modulo the four
// terminals.
Homology \{\{1\}, \{70, 71, 72, 73\}\};

// Find homology space bases isomorphic to the previous bases: homology spaces
// modulo the non-terminal domain surface, a.k.a the thin cuts.
Homology \{\{1\}, \{75\}\};

// Find cohomology space bases isomorphic to the previous bases: cohomology
// spaces of the domain modulo the four terminals, a.k.a the thick cuts.
Cohomology {{1}, {70, 71, 72, 73}};

// More examples:
// Homology {1};
// Homology;
// Homology {{1}, {80}};
// Homology {{}, {80}};

// For more information, see M. Pellikka, S. Suuriniemi, L. Kettunen and
// C. Geuzaine. Homology and cohomology computation in finite element

2.15 t15: Embedded points, lines and surfaces
See t15.geo. Also available in C++ (t15.cpp), Python (t15.py), Julia (t15.jl) and Fortran (t15.f90).

// By default, across geometrical dimensions meshes generated by Gmsh are only
// conformal if lower dimensional entities are on the boundary of higher
// dimensional ones (i.e. if points, curves or surfaces are part of the boundary
// of volumes).

// Embedding constraints allow to force a mesh to be conformal to other lower
// dimensional entities.

// We start one again by including the first tutorial:
Include "t1.geo";

// We change the mesh size to generate coarser mesh
lc = lc * 4;
MeshSize {1:4} = lc;

// We define a new point
Point(5) = {0.02, 0.02, 0, lc};

// One can force this point to be included ("embedded") in the 2D mesh, using
// the 'Point In Surface' command:
Point(5) In Surface{1};

// In the same way, one can force a curve to be embedded in the 2D mesh using
// the 'Curve In Surface' command:
Point(6) = {0.02, 0.12, 0, lc};
Point(7) = {0.04, 0.18, 0, lc};
Line(5) = {6, 7};
Curve(5) In Surface{1};

// One can also embed points and curves in a volume using the 'Curve/Point In
// Volume' commands:
Extrude {0, 0, 0.1}{ Surface {1}; }

p = newp;
Point(p) = {0.07, 0.15, 0.025, lc};
Point(p) In Volume {1};

l = newc;
Point(p+1) = {0.025, 0.15, 0.025, lc};
Line(l) = {7, p+1};
Curve(l) In Volume {1};

// Finally, one can also embed a surface in a volume using the 'Surface In
// Volume' command:
Point(p+2) = {0.02, 0.12, 0.05, lc};
Point(p+3) = {0.04, 0.12, 0.05, lc};
Point(p+4) = {0.04, 0.18, 0.05, lc};
Point(p+5) = {0.02, 0.18, 0.05, lc};
Line(l+1) = {p+2, p+3};
Line(l+2) = {p+3, p+4};
Line(l+3) = {p+4, p+5};
Line(l+4) = {p+5, p+2};

s = news;
Plane Surface(s) = {l1};
Surface(s) In Volume {1};

// Note that with the OpenCASCADE kernel (see ‘t16.geo’), when the
// 'BooleanFragments' command is applied to entities of different dimensions,
// the lower dimensional entities will be automatically embedded in the higher
// dimensional entities if necessary.

Physical Point("Embedded point") = {p};
Physical Curve("Embedded curve") = {l};
Physical Surface("Embedded surface") = {s};
Physical Volume("Volume") = {1};
2.16 t16: Constructive Solid Geometry, OpenCASCADE geometry kernel

See t16.geo. Also available in C++ (t16.cpp), C (t16.c), Python (t16.py), Julia (t16.jl) and Fortran (t16.f90).

// ----------------------------------------------------------------------------
// // Gmsh GEO tutorial 16
// // Constructive Solid Geometry, OpenCASCADE geometry kernel
// // ----------------------------------------------------------------------------

// Instead of constructing a model in a bottom-up fashion with Gmsh's built-in geometry kernel, starting with version 3 Gmsh allows you to directly use alternative geometry kernels. Here we use the OpenCASCADE kernel:

SetFactory("OpenCASCADE");

// Let's build the same model as in 't5.geo', but using constructive solid geometry.

// We first create two cubes:
Box(1) = {0,0,0, 1,1,1};  
Box(2) = {0,0,0, 0.5,0.5,0.5};

// We apply a boolean difference to create the "cube minus one eigth" shape:
BooleanDifference(3) = { Volume{1}; Delete; }{ Volume{2}; Delete; };

// Boolean operations with OpenCASCADE always create new entities. Adding 'Delete' in the arguments allows to automatically delete the original entities.

// We then create the five spheres:
   x = 0 ; y = 0.75 ; z = 0 ; r = 0.09 ;
   For t In {1:5}
      x += 0.166 ;
      z += 0.166 ;
      Sphere(3 + t) = {x,y,z,r};
      Physical Volume(t) = {3 + t};
   EndFor
// If we had wanted five empty holes we would have used ‘BooleanDifference’
// again. Here we want five spherical inclusions, whose mesh should be conformal
// with the mesh of the cube: we thus use ‘BooleanFragments’, which intersects
// all volumes in a conformal manner (without creating duplicate interfaces):
// v() = BooleanFragments{ Volume{3}; Delete; }{ Volume{3 + 1 : 3 + 5}; Delete; };

// When the boolean operation leads to simple modifications of entities, and if
// one deletes the original entities with ‘Delete’, Gmsh tries to assign the
// same tag to the new entities. (This behavior is governed by the
// ‘Geometry.OCCBooleanPreserveNumbering’ option.)

// Here the ‘Physical Volume’ definitions made above will thus still work, as
// the five spheres (volumes 4, 5, 6, 7 and 8), which will be deleted by the
// fragment operations, will be recreated identically (albeit with new surfaces)
// with the same tags.

// The tag of the cube will change though, so we need to access it
// programmatically:
Physical Volume(10) = v(#v()-1);

// Creating entities using constructive solid geometry is very powerful, but can
// lead to practical issues for e.g. setting mesh sizes at points, or
// identifying boundaries.

// To identify points or other bounding entities you can take advantage of the
// ‘PointfsOf’ (a special case of the more general ‘Boundary’ command) and the
// ‘In BoundingBox’ commands.

// Assign a mesh size to all the points of all the volumes:
MeshSize{ PointsOf{ Volume{:}; } } = lcar1;

// Override this constraint on the points of the five spheres:
MeshSize{ PointsOf{ Volume{3 + 1 : 3 + 5}; } } = lcar3;

// Select the corner point by searching for it geometrically:
// Additional examples created with the OpenCASCADE geometry kernel are
// available in ‘t18.geo’, ‘t19.geo’ and ‘t20.geo’, as well as in the
// ‘examples/boolean’ directory.

2.17 t17: Anisotropic background mesh
See t17.geo. Also available in C++ (t17.cpp), Python (t17.py), Julia (t17.jl) and Fortran (t17.f90).
As seen in ‘t7.geo’, mesh sizes can be specified very accurately by providing a background mesh, i.e., a post-processing view that contains the target mesh sizes.

Here, the background mesh is represented as a metric tensor field defined on a square. One should use bamg as 2d mesh generator to enable anisotropic meshes in 2D.

SetFactory("OpenCASCADE");

// Create a square
Rectangle(1) = {-2, -2, 0, 4, 4};

// Merge a post-processing view containing the target anisotropic mesh sizes
Merge "t17_bgmesh.pos";

// Apply the view as the current background mesh
Background Mesh View[0];

// Use bamg
Mesh.SmoothRatio = 3;
Mesh.AnisoMax = 1000;
Mesh.Algorithm = 7;

2.18 t18: Periodic meshes

See t18.geo. Also available in C++ (t18.cpp), Python (t18.py), Julia (t18.jl) and Fortran (t18.f90).
Periodic meshing constraints can be imposed on surfaces and curves.

Let’s use the OpenCASCADE geometry kernel to build two geometries.

SetFactory("OpenCASCADE");

The first geometry is very simple: a unit cube with a non-uniform mesh size constraint (set on purpose to be able to verify visually that the periodicity constraint works!):

Box(1) = {0, 0, 0, 1, 1, 1};
MeshSize {::} = 0.1;
MeshSize {1} = 0.02;

To impose that the mesh on surface 2 (the right side of the cube) should match the mesh from surface 1 (the left side), the following periodicity constraint is set:

Periodic Surface {2} = {1} Translate {1, 0, 0};

During mesh generation, the mesh on surface 2 will be created by copying the mesh from surface 1. Periodicity constraints can be specified with a ‘Translation’, a ‘Rotation’ or a general ‘Affine’ transform.

Multiple periodicities can be imposed in the same way:

Periodic Surface {6} = {5} Translate {0, 0, 1};
Periodic Surface {4} = {3} Translate {0, 1, 0};

For more complicated cases, finding the corresponding surfaces by hand can be tedious, especially when geometries are created through solid modelling. Let’s construct a slightly more complicated geometry.

We start with a cube and some spheres:

Box(10) = {2, 0, 0, 1, 1, 1};
x = 2-0.3; y = 0; z = 0;
Sphere(11) = {x, y, z, 0.35};
Chapter 2: Gmsh tutorial

Sphere(12) = {x+1, y, z, 0.35};
Sphere(13) = {x, y+1, z, 0.35};
Sphere(14) = {x, y, z+1, 0.35};
Sphere(15) = {x+1, y+1, z, 0.35};
Sphere(16) = {x, y+1, z+1, 0.35};
Sphere(17) = {x+1, y, z+1, 0.35};
Sphere(18) = {x+1, y+1, z+1, 0.35};

// We first fragment all the volumes, which will leave parts of spheres
// protruding outside the cube:
v() = BooleanFragments { Volume{10}; Delete; }{ Volume{11:18}; Delete; };

// Ask OpenCASCADE to compute more accurate bounding boxes of entities using the
// STL mesh:
Geometry.OCCBoundsUseStl = 1;

// We then retrieve all the volumes in the bounding box of the original cube,
// and delete all the parts outside it:
eps = 1e-3;
vin() = Volume In BoundingBox {2-eps,-eps,-eps, 2+1+eps,1+eps,1+eps};
v() -= vin();
Recursive Delete{ Volume{v()}; }

// We now set a non-uniform mesh size constraint (again to check results
// visually):
MeshSize { PointsOf{ Volume{vin()}; } } = 0.1;
p() = Point In BoundingBox{2-eps, -eps, -eps, 2+eps, eps, eps};
MeshSize {p()} = 0.001;

// We now identify corresponding surfaces on the left and right sides of the
// geometry automatically.

// First we get all surfaces on the left:
Sxmin() = Surface In BoundingBox{2-eps, -eps, -eps, 2+eps, 1+eps, 1+eps};

For i In {0:#Sxmin()-1}
  // Then we get the bounding box of each left surface
  bb() = BoundingBox Surface { Sxmin(i) };
  // We translate the bounding box to the right and look for surfaces inside it:
  Sxmax() = Surface In BoundingBox { bb(0)-eps+1, bb(1)-eps, bb(2)-eps,
    bb(3)+eps+1, bb(4)+eps, bb(5)+eps };
  // For all the matches, we compare the corresponding bounding boxes...
  For j In {0:#Sxmax()-1}
    bb2() = BoundingBox Surface { Sxmax(j) };
    bb2(0) -= 1;
    bb2(3) -= 1;
    // ...and if they match, we apply the periodicity constraint
    If(Fabs(bb2(0)-bb(0)) < eps & & Fabs(bb2(1)-bb(1)) < eps & &
      Fabs(bb2(2)-bb(2)) < eps & & Fabs(bb2(3)-bb(3)) < eps & &
      Fabs(bb2(4)-bb(4)) < eps & & Fabs(bb2(5)-bb(5)) < eps)
      Periodic Surface {Sxmax(j)} = {Sxmin(i)} Translate {1,0,0};
    EndIf
2.19 t19: Thrusections, fillets, pipes, mesh size from curvature

See t19.geo. Also available in C++ (t19.cpp), Python (t19.py), Julia (t19.jl) and Fortran (t19.f90).

// The OpenCASCADE geometry kernel supports several useful features for solid
// modelling.

SetFactory("OpenCASCADE");

// Volumes can be constructed from (closed) curve loops thanks to the
// ‘ThruSections’ command
Circle(1) = {0,0,0, 0.5}; Curve Loop(1) = 1;
Circle(2) = {0.1,0.05,1, 0.1}; Curve Loop(2) = 2;
Circle(3) = {-0.1,-0.1,2, 0.3}; Curve Loop(3) = 3;
ThruSections(1) = {1:3};

// With ‘Ruled ThruSections’ you can force the use of ruled surfaces:
Circle(11) = {2+0,0,0, 0.5}; Curve Loop(11) = 11;
Circle(12) = {2+0.1,0.05,1, 0.1}; Curve Loop(12) = 12;
Circle(13) = {2-0.1,-0.1,2, 0.3}; Curve Loop(13) = 13;
Ruled ThruSections(11) = {11:13};

// We copy the first volume, and fillet all its edges:
v() = Translate{4, 0, 0} { Duplicata{ Volume{1}; } };  
f() = Abs(Boundary{ Volume{v(0)}; });  
e() = Unique(Abs(Boundary{ Surface{f()}; }));  
Fillet{v(0)}{e()}{0.1}

// OpenCASCADE also allows general extrusions along a smooth path. Let’s first
// define a spline curve:
nturns = 1;
npts = 20;
r = 1;
h = 1 * nturns;
For i In {0 : npts - 1}
    theta = i * 2*Pi*nturns/npts;
    Point(1000 + i) = {r * Cos(theta), r * Sin(theta), i * h/npts};
EndFor
Spline(1000) = {1000 : 1000 + npts - 1};

// A wire is like a curve loop, but open:
Wire(1000) = {1000};

// We define the shape we would like to extrude along the spline (a disk):
Disk(1000) = {1,0,0, 0.2};
Rotate {{1, 0, 0}, {0, 0, 0}, Pi/2} { Surface{1000}; } 

// We extrude the disk along the spline to create a pipe:
Extrude { Surface{1000}; } Using Wire {1000}

// We delete the source surface, and increase the number of sub-edges for a
// nicer display of the geometry:
Delete{ Surface{1000}; } 
Geometry.NumSubEdges = 1000;

// We can activate the calculation of mesh element sizes based on curvature
// (here with a target of 20 elements per 2*Pi radians):
Mesh.MeshSizeFromCurvature = 20;

// We can constraint the min and max element sizes to stay within reasonable
// values (see 't10.geo' for more details):
Mesh.MeshSizeMin = 0.001;
Mesh.MeshSizeMax = 0.3;

2.20 t20: STEP import and manipulation, geometry partitioning

See t20.geo. Also available in C++ (t20.cpp), Python (t20.py), Julia (t20.jl) and Fortran (t20.f90).
SetFactory("OpenCASCADE");

// Load a STEP file (using 'ShapeFromFile' instead of 'Merge' allows to directly
// retrieve the tags of the highest dimensional imported entities):
v() = ShapeFromFile("t20_data.step");

// If we had specified
//
// Geometry.OCCTargetUnit = "M";
//
// before merging the STEP file, OpenCASCADE would have converted the units to
// meters (instead of the default, which is millimeters).

bbox() = BoundingBox Volume{v()};

xmin = bbox(0);
ymin = bbox(1);
zmin = bbox(2);
xmax = bbox(3);
ymax = bbox(4);
zmax = bbox(5);

// We want to slice the model into N slices, and either keep the volume slices
// or just the surfaces obtained by the cutting:
DefineConstant[
    N = {5, Min 2, Max 100, Step 1, Name "Parameters/0Number of slices"}
    dir = {0, Choices{0="X", 1="Y", 2="Z"}, Name "Parameters/1Direction"}
    surf = {0, Choices{0, 1}, Name "Parameters/2Keep only surfaces?"}
];

dx = (xmax - xmin);
dy = (ymax - ymin);
dz = (zmax - zmin);
L = (dir == 0) ? dz : dx;
H = (dir == 1) ? dz : dy;

// Create the first cutting plane:
s() = {news};
Rectangle(s(0)) = {xmin, ymin, zmin, L, H};
If(dir == 0)
    Rotate{ {0, 1, 0}, {xmin, ymin, zmin}, -Pi/2 } { Surface{s(0)}; }
ElseIf(dir == 1)
Rotate{ {1, 0, 0}, {xmin, ymin, zmin}, Pi/2 } { Surface{s(0)}; }
EndIf

\[
\begin{align*}
\text{tx} &= (\text{dir} == 0) ? \text{dx} / N : 0; \\
\text{ty} &= (\text{dir} == 1) ? \text{dy} / N : 0; \\
\text{tz} &= (\text{dir} == 2) ? \text{dz} / N : 0;
\end{align*}
\]

Translate{tx, ty, tz} { Surface{s(0)}; }

// Create the other cutting planes:
For i In {1:N-2}
  s() += Translate{i * tx, i * ty, i * tz} { Duplicata{ Surface{s(0)}; } };
EndFor

// Fragment (i.e. intersect) the volume with all the cutting planes:
BooleanFragments{ Volume{v(); Delete; }{ Surface{s(); Delete; } }

// Now remove all the surfaces (and their bounding entities) that are not on the
// boundary of a volume, i.e. the parts of the cutting planes that "stick out"
// of the volume:
Recursive Delete { Surface{:}; }

If(surf)
  // If we want to only keep the surfaces, retrieve the surfaces in bounding
  // boxes around the cutting planes...
  eps = 1e-4;
  s() = { }; 
  For i In {1:N-1}
    xx = (dir == 0) ? xmin : xmax;
    yy = (dir == 1) ? ymin : ymax;
    zz = (dir == 2) ? zmin : zmax;
    s() += Surface In BoundingBox
      {xmin - eps + i * tx, ymin - eps + i * ty, zmin - eps + i * tz, 
      xx + eps + i * tx, yy + eps + i * ty, zz + eps + i * tz};
  EndFor
  // ...and remove all the other entities:
  dels = Surface{:};
  dels -= s();
  Delete { Volume{:}; Surface{dels(); Curve{:}; Point{:}; } 
EndIf

// Finally, let's specify a global mesh size:
Mesh.MeshSizeMin = 3;
Mesh.MeshSizeMax = 3;

// To partition the mesh instead of the geometry, see 't21.geo'.

2.21  t21: Mesh partitioning
See t21.geo. Also available in C++ (t21.cpp), Python (t21.py), Julia (t21.jl) and Fortran (t21.f90).
Gmsh can partition meshes using different algorithms, e.g. the graph
partitioner Metis or the ‘SimplePartition’ plugin. For all the partitioning
algorithms, the relationship between mesh elements and mesh partitions is
encoded through the creation of new (discrete) elementary entities, called
"partition entities".

Partition entities behave exactly like other discrete elementary entities;
the only difference is that they keep track of both a mesh partition index
and their parent elementary entity.

The major advantage of this approach is that it allows to maintain a full
boundary representation of the partition entities, which Gmsh creates
automatically if ‘Mesh.PartitionCreateTopology’ is set.

Let us start by creating a simple geometry with two adjacent squares sharing
an edge:
SetFactory("OpenCASCADE");
Rectangle(1) = {0, 0, 0, 1, 1};
Rectangle(2) = {1, 0, 0, 1, 1};
BooleanFragments{ Surface{1}; Delete; }{ Surface{2}; Delete; }
MeshSize {:} = 0.05;

We create one physical group for each square, and we mesh the resulting
geometry:
Physical Surface("Left", 100) = 1;
Physical Surface("Right", 200) = 2;
Mesh 2;

We now define several constants to fine-tune how the mesh will be partitioned
DefineConstant[
    partitioner = {0, Choices{0="Metis", 1="SimplePartition"},
        Name "Parameters/OMesh partitioner"}
    N = {3, Min 1, Max 256, Step 1,
        Name "Parameters/INumber of partitions"}
    topology = {1, Choices{0, 1},
}
Name "Parameters/2Create partition topology (BRep)?"
ghosts = {0, Choices{0, 1},
    Name "Parameters/3Create ghost cells?"
physicals = {0, Choices{0, 1},
    Name "Parameters/3Create new physical groups?"
write = {1, Choices {0, 1},
    Name "Parameters/3Write file to disk?"
split = {0, Choices {0, 1},
    Name "Parameters/4Write one file per partition?"
};

// Should we create the boundary representation of the partition entities?
Mesh.PartitionCreateTopology = topology;

// Should we create ghost cells?
Mesh.PartitionCreateGhostCells = ghosts;

// Should we automatically create new physical groups on the partition entities?
Mesh.PartitionCreatePhysicals = physicals;

// Should we keep backward compatibility with pre-Gmsh 4, e.g. to save the mesh
// in MSH2 format?
Mesh.PartitionOldStyleMsh2 = 0;

// Should we save one mesh file per partition?
Mesh.PartitionSplitMeshFiles = split;

If (partitioner == 0)
    // Use Metis to create N partitions
    PartitionMesh N;
    // Several options can be set to control Metis: 'Mesh.MetisAlgorithm' (1: 
    // Recursive, 2: K-way), 'Mesh.MetisObjective' (1: min. edge-cut, 2: 
    // min. communication volume), 'Mesh.PartitionTriWeight' (weight of 
    // triangles), 'Mesh.PartitionQuadWeight' (weight of quads), ...
Else
    // Use the 'SimplePartition' plugin to create chessboard-like partitions
    Plugin(SimplePartition).NumSlicesX = N;
    Plugin(SimplePartition).NumSlicesY = 1;
    Plugin(SimplePartition).NumSlicesZ = 1;
    Plugin(SimplePartition).Run;
EndIf

// Save mesh file (or files, if 'Mesh.PartitionSplitMeshFiles' is set):
If(write)
    Save "t21.msh";
EndIf

2.22 x1: Geometry and mesh data
See x1.py. Also available in C++ (x1.cpp) and Julia (x1.jl).
import gmsh
import sys

gmsh.initialize()

if len(sys.argv) > 1:
    # If an argument is provided, handle it as a file that Gmsh can read, e.g. a
    # mesh file in the MSH format ('python x1.py file.msh')
    gmsh.open(sys.argv[1])
else:
    # Otherwise, create and mesh a simple geometry
    gmsh.model.occ.addCone(1, 0, 0, 1, 0, 0, 0.5, 0.1)
    gmsh.model.occ.synchronize()
    gmsh.model.mesh.generate()

# Print the model name and dimension:
print('Model ' + gmsh.model.getCurrent() + ' (' + str(gmsh.model.getDimension()) + 'D)')

# Geometrical data is made of elementary model 'entities', called 'points'
# (entities of dimension 0), 'curves' (entities of dimension 1), 'surfaces'
# (entities of dimension 2) and 'volumes' (entities of dimension 3). As we have
# seen in the other Python tutorials, elementary model entities are identified
# by their dimension and by a 'tag': a strictly positive identification
# number. Model entities can be either CAD entities (from the built-in 'geo'
# kernel or from the OpenCASCADE 'occ' kernel) or 'discrete' entities (defined
# by a mesh). 'Physical groups' are collections of model entities and are also
# identified by their dimension and by a tag.
# Get all the elementary entities in the model, as a vector of (dimension, tag) # pairs:

entities = gmsh.model.getEntities()

for e in entities:
    # Dimension and tag of the entity:
    dim = e[0]
    tag = e[1]

    # Mesh data is made of 'elements' (points, lines, triangles, ...), defined # by an ordered list of their 'nodes'. Elements and nodes are identified by # 'tags' as well (strictly positive identification numbers), and are stored # ("classified") in the model entity they discretize. Tags for elements and # nodes are globally unique (and not only per dimension, like entities).

    # A model entity of dimension 0 (a geometrical point) will contain a mesh # element of type point, as well as a mesh node. A model curve will contain # line elements as well as its interior nodes, while its boundary nodes will # be stored in the bounding model points. A model surface will contain # triangular and/or quadrangular elements and all the nodes not classified # on its boundary or on its embedded entities. A model volume will contain # tetrahedra, hexahedra, etc. and all the nodes not classified on its # boundary or on its embedded entities.

    # Get the mesh nodes for the entity (dim, tag):
    nodeTags, nodeCoords, nodeParams = gmsh.model.mesh.getNodes(dim, tag)

    # Get the mesh elements for the entity (dim, tag):
    elemTypes, elemTags, elemNodeTags = gmsh.model.mesh.getElements(dim, tag)

    # Elements can also be obtained by type, by using 'getElementTypes()', # followed by 'getElementsByType()'.

    # Let's print a summary of the information available on the entity and its # mesh.

    # * Type and name of the entity:
    type = gmsh.model.getType(dim, tag)
    name = gmsh.model.getEntityName(dim, tag)
    if len(name): name += ' ' 
    print("Entity " + name + str(e) + " of type " + str(type))

    # * Number of mesh nodes and elements:
    numElem = sum(len(i) for i in elemTags)
    print(" - Mesh has " + str(len(nodeTags)) + " nodes and " + str(numElem) + " elements")

    # * Upward and downward adjacencies:
    up, down = gmsh.model.getAdjacencies(dim, tag)
    if len(up):
        print(" - Upward adjacencies: " + str(up))
if len(down):
    print(" - Downward adjacencies: " + str(down))

# * Does the entity belong to physical groups?
physicalTags = gmsh.model.getPhysicalGroupsForEntity(dim, tag)
if len(physicalTags):
    s = ''
    for p in physicalTags:
        n = gmsh.model.getPhysicalName(dim, p)
        if n: n += ' ' 
        s += n + '(' + str(dim) + ', ' + str(p) + ')' + ' ' 
    print(" - Physical groups: " + s)

# * Is the entity a partition entity? If so, what is its parent entity?
partitions = gmsh.model.getPartitions(dim, tag)
if len(partitions):
    print(" - Partition tags: " + str(partitions) + " - parent entity " + str(gmsh.model.getParent(dim, tag)))

# * List all types of elements making up the mesh of the entity:
for t in elemTypes:
    name, dim, order, numv, parv, _ = gmsh.model.mesh.getElementProperties(t)
    print(" - Element type: " + name + " , order " + str(order) + " (" + str(numv) + " nodes in param coord: " + str(parv) + "))

# Launch the GUI to see the model:
if '-nopopup' not in sys.argv:
    gmsh.fltk.run()

# We can use this to clear all the model data:
gmsh.clear()

gmsh.finalize()

2.23 x2: Mesh import, discrete entities, hybrid models, terrain meshing

See x2.py. Also available in C++ (x2.cpp) and Julia (x2.jl).
import gmsh
import sys
import math

# The API can be used to import a mesh without reading it from a file, by
# creating nodes and elements on the fly and storing them in model
# entities. These model entities can be existing CAD entities, or can be
# discrete entities, entirely defined by the mesh.
#
# Discrete entities can be reparametrized (see ‘t13.py’) so that they can be
# remeshed later on; and they can also be combined with built-in CAD entities to
# produce hybrid models.
#
# We combine all these features in this tutorial to perform terrain meshing,
# where the terrain is described by a discrete surface (that we then
# reparametrize) combined with a CAD representation of the underground.

gmsh.initialize()

gmsh.model.add("x2")

# We will create the terrain surface mesh from N x N input data points:
N = 100

# Helper function to return a node tag given two indices i and j:

    # Type 1 for 2-node line elements:
    gmsh.model.mesh.addElement(i + 1, 1, [], lin[i])
    # Type 2 for 3-node triangle elements:
    gmsh.model.mesh.addElement(i + 1, 2, [], tris)

# Reclassify the nodes on the curves and the points (since we put them all on
# the surface before with 'addNodes' for simplicity)
    gmsh.model.mesh.reclassifyNodes()

# Create a geometry for the discrete curves and surfaces, so that we can remesh
# them later on:
    gmsh.model.mesh.createGeometry()
Note that for more complicated meshes, e.g. for on input unstructured STL mesh, we could use `classifySurfaces()` to automatically create the discrete entities and the topology; but we would then have to extract the boundaries afterwards.

Create other built-in CAD entities to form one volume below the terrain surface. Beware that only built-in CAD entities can be hybrid, i.e. have discrete entities on their boundary: OpenCASCADE does not support this feature.

```python
p1 = gmsh.model.geo.addPoint(0, 0, -0.5)
p2 = gmsh.model.geo.addPoint(1, 0, -0.5)
p3 = gmsh.model.geo.addPoint(1, 1, -0.5)
p4 = gmsh.model.geo.addPoint(0, 1, -0.5)
c1 = gmsh.model.geo.addLine(p1, p2)
c2 = gmsh.model.geo.addLine(p2, p3)
c3 = gmsh.model.geo.addLine(p3, p4)
c4 = gmsh.model.geo.addLine(p4, p1)
c10 = gmsh.model.geo.addLine(p1, 1)
c11 = gmsh.model.geo.addLine(p2, 2)
c12 = gmsh.model.geo.addLine(p3, 3)
c13 = gmsh.model.geo.addLine(p4, 4)
ll1 = gmsh.model.geo.addCurveLoop([c1, c2, c3, c4])
s1 = gmsh.model.geo.addPlaneSurface([ll1])
ll3 = gmsh.model.geo.addCurveLoop([c1, c11, -1, -c10])
s3 = gmsh.model.geo.addPlaneSurface([ll3])
ll4 = gmsh.model.geo.addCurveLoop([c2, c12, -2, -c11])
s4 = gmsh.model.geo.addPlaneSurface([ll4])
ll5 = gmsh.model.geo.addCurveLoop([c3, c13, 3, -c12])
s5 = gmsh.model.geo.addPlaneSurface([ll5])
ll6 = gmsh.model.geo.addCurveLoop([c4, c10, 4, -c13])
s6 = gmsh.model.geo.addPlaneSurface([ll6])
sl1 = gmsh.model.geo.addSurfaceLoop([s1, s3, s4, s5, s6, 1])
v1 = gmsh.model.geo.addVolume([sl1])
gmsh.model.geo.synchronize()
```

Set this to True to build a fully hex mesh:

```python
if transfinite:
    NN = 30
    for c in gmsh.model.getEntities(1):
        gmsh.model.mesh.setTransfiniteCurve(c[1], NN)
    for s in gmsh.model.getEntities(2):
        gmsh.model.mesh.setTransfiniteSurface(s[1])
        gmsh.model.mesh.setRecombine(s[0], s[1])
        gmsh.model.mesh.setSmoothing(s[0], s[1], 100)
    gmsh.model.mesh.setTransfiniteVolume(v1)
else:
    gmsh.option.setNumber('Mesh.MeshSizeMin', 0.5)
```
gmsh.option.setNumber('Mesh.MeshSizeMax', 0.5)
# setTransfiniteAutomatic() uses the sizing constraints to set the number
# of points
gmsh.model.mesh.setTransfiniteAutomatic()
else:
    gmsh.option.setNumber('Mesh.MeshSizeMin', 0.05)
    gmsh.option.setNumber('Mesh.MeshSizeMax', 0.05)

gmsh.model.mesh.generate(3)
gmsh.write('x2.msh')

# Launch the GUI to see the results:
if '-nopopup' not in sys.argv:
    gmsh.fltk.run()

gmsh.finalize()

2.24 x3: Post-processing data import: list-based

See x3.py. Also available in C++ (x3.cpp) and Julia (x3.jl).

# -----------------------------------------------------------------------------
# # Gmsh Python extended tutorial 3
# # Post-processing data import: list-based
# # -----------------------------------------------------------------------------

import gmsh
import sys

gmsh.initialize(sys.argv)

# Gmsh supports two types of post-processing data: "list-based" and
# "model-based". Both types of data are handled through the 'view' interface.

# List-based views are completely independent from any model and any mesh: they
# are self-contained and simply contain lists of coordinates and values, element
# by element, for 3 types of fields (scalar "S", vector "V" and tensor "T") and
# several types of element shapes (point "P", line "L", triangle "T", quadrangle
# "Q", tetrahedron "S", hexahedron "H", prism "I" and pyramid "Y"). (See ‘x4.py’
# for a tutorial on model-based views.)

# To create a list-based view one should first create a view:
t1 = gmsh.view.add("A list-based view")

# List-based data is then added by specifying the type as a 2 character string
# that combines a field type and an element shape (e.g. "ST" for a scalar field
# on triangles), the number of elements to be added, and the concatenated list
# of coordinates (e.g. 3 "x" coordinates, 3 "y" coordinates, 3 "z" coordinates
# for first order triangles) and values for each element (e.g. 3 values for
# first order scalar triangles, repeated for each step if there are several time
# steps).

# Let's create two triangles...
triangle1 = [0., 1., 1., # x coordinates of the 3 triangle nodes
            0., 0., 1., # y coordinates of the 3 triangle nodes
            0., 0., 0.] # z coordinates of the 3 triangle nodes
triangle2 = [0., 1., 0., 0., 1., 1., 0., 0., 0.]

# ... and append values for 10 time steps
for step in range(0, 10):
    triangle1.extend([10., 11. - step, 12.]) # 3 node values for each step
    triangle2.extend([11., 12., 13. + step])

# List-based data is just added by concatenating the data for all the triangles:
gmsh.view.addListData(t1, "ST", 2, triangle1 + triangle2)

# Internally, post-processing views parsed by the .geo file parser create such
# list-based data (see e.g. ‘t7.py’, ‘t8.py’ and ‘t9.py’), independently of any
# mesh.

# Vector or tensor fields can be imported in the same way, the only difference
# beeing the type (starting with "V" for vector fields and "T" for tensor
# fields) and the number of components. For example a vector field on a line
# element can be added as follows:
line = [0., 1., # x coordinate of the 2 line nodes
       1.2, 1.2, # y coordinate of the 2 line nodes
       0., 0.] # z coordinate of the 2 line nodes
for step in range(0, 10):
    line.extend([10. + step, 0., 0.,
                 10. + step, 0., 0.])
gmsh.view.addListData(t1, "VL", 1, line)

# List-based data can also hold 2D (in window coordinates) and 3D (in model
# coordinates) strings (see ‘t4.py’). Here we add a 2D string located on the
# bottom-left of the window (with a 20 pixels offset), as well as a 3D string
# located at model coordinates (0.5, 0.5, 0):
gmsh.view.addListDataString(t1, [20., -20.], 
                            ["Created with Gmsh"])
gmsh.view.addListDataString(t1, [0.5, 1.5, 0.],
                            ["Created with Gmsh", "Another string"])
# The various attributes of the view can be queried and changed using the option interface:
gmsh.view.option.setNumber(t1, "TimeStep", 5)
gmsh.view.option.setNumber(t1, "IntervalsType", 3)
ns = gmsh.view.option.getNumber(t1, "NbTimeStep")
print("View \" + str(t1) + \" has \" + str(ns) + \" time steps")

# Views can be queried and modified in various ways using plugins (see 't9.py'),
# or probed directly using 'gmsh.view.probe()' - here at point (0.9, 0.1, 0):
print("Value at (0.9, 0.1, 0)", gmsh.view.probe(t1, 0.9, 0.1, 0))

# Views can be saved to disk using 'gmsh.view.write()':
gmsh.view.write(t1, "x3.pos")

# High-order datasets can be provided by setting the interpolation matrices explicitly. Let's create a second view with second order interpolation on a 4-node quadrangle.

# Add a new view:
t2 = gmsh.view.add("Second order quad")

# Set the node coordinates:
quad = [0., 1., 1., 0., # x coordinates of the 4 quadrangle nodes
       -1.2, -1.2, -0.2, -0.2, # y coordinates of the 4 quadrangle nodes
       0., 0., 0., 0.] # z coordinates of the 4 quadrangle nodes

# Set the two interpolation matrices c[i][j] and e[i][j] defining the d = 9 basis functions: f[i](u, v, w) = sum_(j = 0, ..., d - 1) c[i][j] u^e[j][0]
# v^e[j][i] w^e[j][2], i = 0, ..., d-1, with u, v, w the coordinates in the reference element:
gmsh.view.setInterpolationMatrices(t2, "Quadrangle", 9,
     [0, 0, 0.25, 0, 0, -0.25, -0.25, 0, 0.25,
      0, 0.25, 0, 0, -0.25, 0.25, 0, 0.25,
      0, 0.25, 0, 0, 0.25, 0.25, 0, 0.25,
      0, 0, 0.25, 0, 0, -0.25, 0.25, 0, -0.25,
      0, 0, 0.25, 0, 0.25, 0, 0, 0.25,
      0, 0, -0.5, 0.5, 0, 0.5, 0, -0.5, 0,
      0, 0.5, -0.5, 0, 0.5, 0, -0.5, 0, 0,
      0, 0, -0.5, 0.5, 0, -0.5, 0, 0.5, 0,
      0, 0.5, -0.5, 0, -0.5, 0, 0.5, 0, 0,
      1, -1, 1, -1, 0, 0, 0, 0, 0],
     [0, 0, 0, 2, 0, 0, 0, 2, 0,
      0, 0, 2, 0, 1, 0, 0, 2, 1, 0,
# Note that two additional interpolation matrices could also be provided to
# interpolate the geometry, i.e. to interpolate curved elements.

# Add the data to the view:
gmsh.view.addData(t2, "SQ", 1, quad)

# In order to visualize the high-order field, one must activate adaptive
# visualization, set a visualization error threshold and a maximum subdivision
# level (Gmsh does automatic mesh refinement to visualize the high-order field
# with the requested accuracy):
gmsh.view.option.setNumber(t2, "AdaptVisualizationGrid", 1)
gmsh.view.option.setNumber(t2, "TargetError", 1e-2)
gmsh.view.option.setNumber(t2, "MaxRecursionLevel", 5)

# Note that the adapted visualization data can be retrieved by setting the
# 'returnAdaptive' argument to the 'gmsh.view.getListData()' function.

# Launch the GUI to see the results:
if '-nopopup' not in sys.argv:
gmsh.fltk.run()

gmsh.finalize()

## 2.25 x4: Post-processing data import: model-based

See x4.py. Also available in C++ (x4.cpp) and Julia (x4.jl).
gmsh.initialize(sys.argv)

# Contrary to list-based view (see 'x3.py'), model-based views are based on one
# or more meshes. Compared to list-based views, they are thus linked to one
# model (per step). Post-processing data stored in MSH files create such
# model-based views.

# Let's create a first model-based view using a simple mesh constructed by
# hand. We create a model with a discrete surface
gmsh.model.add("simple model")
surf = gmsh.model.addDiscreteEntity(2)

# We add 4 nodes and 2 3-node triangles (element type "2")
gmsh.model.mesh.addNodes(2, surf, [1, 2, 3, 4],
        [0., 0., 0., 1., 0., 0., 1., 1., 0., 0., 1., 0.])
gmsh.model.mesh.addElementsByType(surf, 2, [1, 2], [1, 2, 3, 1, 3, 4])

# We can now create a new model-based view, to which we add 10 steps of
# node-based data:
t1 = gmsh.view.add("Continuous")
for step in range(0, 10):
    gmsh.view.addHomogeneousModelData(
        t1, step, "simple model", "NodeData",
        [1, 2, 3, 4], # tags of nodes
        [10., 10., 12. + step, 13. + step]) # data, per node

# Beside node-based data, which result in continuous fields, one can also add
# general discontinous fields defined at the nodes of each element, using
# "ElementNodeData":
t2 = gmsh.view.add("Discontinuous")
for step in range(0, 10):
    gmsh.view.addHomogeneousModelData(
        t2, step, "simple model", "ElementNodeData",
        [1, 2], # tags of elements
        [10., 10., 12. + step, 14., 15., 13. + step]) # data per element nodes

# Constant per element datasets can also be created using "ElementData". Note
# that a more general function 'addModelData' to add data for hybrid meshes
# (when data is not homogeneous, i.e. when the number of nodes changes between
# elements) is also available.

# Each step of a model-based view can be defined on a different model, i.e. on a
# different mesh. Let's define a second model and mesh it
gmsh.model.add("another model")
gmsh.model.occ.addBox(0, 0, 0, 1, 1, 1)
gmsh.model.occ.synchronize()
gmsh.model.mesh.generate(3)

# We can add other steps to view "t" based on this new mesh:
node, coord, _ = gmsh.model.mesh.getNodes()
for step in range(11, 20):
    gmsh.view.addHomogeneousModelData(
t1, step, "another model", "NodeData", nodes,
[step * coord[i] for i in range(0, len(coord), 3))]

# This feature allows to create seamless animations for time-dependent datasets
# on deforming or remeshed models.

# High-order node-based datasets are supported without needing to supply the
# interpolation matrices (iso-parametric Lagrange elements). Arbitrary
# high-order datasets can be specified as "ElementNodeData", with the
# interpolation matrices specified in the same as as for list-based views (see
# 'x3.py').

# Model-based views can be saved to disk using 'gmsh.view.write()'; note that
# saving a view based on multiple meshes (like the view 't1') will automatically
# create several files. If the 'PostProcessing.SaveMesh' option is not set,
# 'gmsh.view.write()' will only save the view data, without the mesh (which
# could be saved independently with 'gmsh.write()').
gmsh.view.write(t1, "x4_t1.msh")
gmsh.view.write(t2, "x4_t2.msh")

# Launch the GUI to see the results:
if '-nopopup' not in sys.argv:
    gmsh.fltk.run()
gmsh.finalize()

2.26 x5: Additional geometrical data: parametrizations,
normals, curvatures

See x5.py. Also available in C++ (x5.cpp) and Julia (x5.jl).
gmsh.initialize(sys.argv)

# The API provides access to geometrical data in a CAD kernel agnostic manner.

# Let's create a simple CAD model by fusing a sphere and a cube, then mesh the
# surfaces:
gmsh.model.add("x5")
s = gmsh.model.occ.addSphere(0, 0, 0, 1)
b = gmsh.model.occ.addBox(0.5, 0, 0, 1.3, 2, 3)
gmsh.model.occ.fuse([(3, s)], [(3, b)])
gmsh.model.occ.synchronize()
gmsh.model.mesh.generate(2)

# We can for example retrieve the exact normals and the curvature at all the
# mesh nodes (i.e. not normals and curvatures computed from the mesh, but
# directly evaluated on the geometry), by querying the CAD kernels at the
# corresponding parametric coordinates.
normals = []
curvatures = []

# For each surface in the model:
for e in gmsh.model.getEntities(2):
    # Retrieve the surface tag
    s = e[1]

    # Get the mesh nodes on the surface, including those on the boundary
    # (contrary to internal nodes, which store their parametric coordinates,
    # boundary nodes will be reparametrized on the surface in order to compute
    # their parametric coordinates, the result being different when
    # reparametrized on another adjacent surface)
tags, coord, param = gmsh.model.mesh.getNodes(2, s, True)

    # Get the surface normals on all the points on the surface corresponding to
    # the parametric coordinates of the nodes
    norm = gmsh.model.getNormal(s, param)

    # In the same way, get the curvature
curv = gmsh.model.getCurvature(2, s, param)

    # Store the normals and the curvatures so that we can display them as
    # list-based post-processing views
    for i in range(0, len(coord), 3):
        normals.append(coord[i])
        normals.append(coord[i + 1])
        normals.append(coord[i + 2])
        normals.append(norm[i])
        normals.append(norm[i + 1])
        normals.append(norm[i + 2])
        curvatures.append(coord[i])
        curvatures.append(coord[i + 1])
        curvatures.append(coord[i + 2])
curvatures.append(curv[i // 3])

# Create a list-based vector view on points to display the normals, and a scalar
# view on points to display the curvatures
vn = gmsh.view.add("normals")
gmsh.view.addListData(vn, "VP", len(normals) // 6, normals)
gmsh.view.option.setNumber(vn, 'ShowScale', 0)
gmsh.view.option.setNumber(vn, 'ArrowSizeMax', 30)
gmsh.view.option.setNumber(vn, 'ColormapNumber', 19)
vc = gmsh.view.add("curvatures")
gmsh.view.addListData(vc, "SP", len(curvatures) // 4, curvatures)
gmsh.view.option.setNumber(vc, 'ShowScale', 0)

# We can also retrieve the parametrization bounds of model entities, e.g. of
# curve 5, and evaluate the parametrization for several parameter values:
bounds = gmsh.model.getParametrizationBounds(1, 5)
N = 20
t = [bounds[0][0] + i * (bounds[1][0] - bounds[0][0]) / N for i in range(N)]
xyz1 = gmsh.model.getValue(1, 5, t)

# We can also reparametrize curve 5 on surface 1, and evaluate the points in the
# parametric plane of the surface:
uv = gmsh.model.reparametrizeOnSurface(1, 5, t, 1)
xyz2 = gmsh.model.getValue(2, 1, uv)

# Hopefully we get the same x, y, z coordinates!
if max([abs(a - b) for (a, b) in zip(xyz1, xyz2)]) < 1e-12:
    gmsh.logger.write('Evaluation on curve and surface match!')
else:
    gmsh.logger.write('Evaluation on curve and surface do not match!', 'error')

# Launch the GUI to see the results:
if '-nopopup' not in sys.argv:
gmsh.fltk.run()

gmsh.finalize()

2.27 x6: Additional mesh data: integration points, Jacobians
           and basis functions

See x6.py. Also available in C++ (x6.cpp) and Julia (x6.jl).

# ----------------------------------------------------------------------------------
# # Gmsh Python extended tutorial 6
# # Additional mesh data: integration points, Jacobians and basis functions
# # ----------------------------------------------------------------------------------

import gmsh
import sys
gmsh.initialize(sys.argv)

2.28 x7: Additional mesh data: internal edges and faces

See x7.py. Also available in C++ (x7.cpp) and Julia (x7.jl).

```python
# Additional mesh data: internal edges and faces
#
import sys
import gmsh
gmsh.initialize(sys.argv)
gmsh.model.add("x7")

gmsh.model.occ.addBox(0, 0, 0, 1, 1, 1)
gmsh.model.occ.synchronize()
gmsh.option.setNumber("Mesh.MeshSizeMin", 2.)
gmsh.model.mesh.generate(3)

elementType = gmsh.model.mesh.getElementType("tetrahedron", 1)
edgeNodes = gmsh.model.mesh.getElementEdgeNodes(elementType)
```
faceNodes = gmsh.model.mesh.getElementFaceNodes(elementType, 3)

# Edges and faces are returned for each element as a list of nodes corresponding
# to the canonical orientation of the edges and faces for a given element type.

# Gmsh can also identify unique edges and faces (a single edge or face whatever
# the ordering of their nodes) and assign them a unique tag. This identification
# can be done internally by Gmsh (e.g. when generating keys for basis
# functions), or requested explicitly as follows:
gmsh.model.mesh.createEdges()
gmsh.model.mesh.createFaces()

# Edge and face tags can then be retrieved by providing their nodes:
edgeTags, edgeOrientations = gmsh.model.mesh.getEdges(edgeNodes)
faceTags, faceOrientations = gmsh.model.mesh.getFaces(3, faceNodes)

# Since element edge and face nodes are returned in the same order as the
# elements, one can easily keep track of which element(s) each edge or face is
# connected to:
elementTags, elementNodeTags = gmsh.model.mesh.getElementsByType(elementType)
edges2Elements = {}
faces2Elements = {}
for i in range(len(edgeTags)):  # 6 edges per tetrahedron
    if not edgeTags[i] in edges2Elements:
        edges2Elements[edgeTags[i]] = [elementTags[i // 6]]
    else:
        edges2Elements[edgeTags[i]].append(elementTags[i // 6])
for i in range(len(faceTags)):  # 4 faces per tetrahedron
    if not faceTags[i] in faces2Elements:
        faces2Elements[faceTags[i]] = [elementTags[i // 4]]
    else:
        faces2Elements[faceTags[i]].append(elementTags[i // 4])

# New unique lower dimensional elements can also be easily created given the
# edge or face nodes. This is especially useful for numerical methods that
# require integrating or interpolating on internal edges or faces (like
# e.g. Discontinuous Galerkin techniques), since creating elements for the
# internal entities will make this additional mesh data readily available (see
# '#x6.py'). For example, we can create a new discrete surface...
s = gmsh.model.addDiscreteEntity(2)

# ... and fill it with unique triangles corresponding to the faces of the
tetrahedra:
maxElementTag = gmsh.model.mesh.getMaxElementTag()
uniqueFaceTags = set()
tagForTriangles = []
faceNodesForTriangles = []
for i in range(len(faceTags)):
    if faceTags[i] not in uniqueFaceTags:
        uniqueFaceTags.add(faceTags[i])
tagForTriangles.append(faceTags[i] + maxElementTag)
faceNodesForTriangles.append(faceNodes[3 * i])
faceNodesForTriangles.append(faceNodes[3 * i + 1])
faceNodesForTriangles.append(faceNodes[3 * i + 2])
elementType2D = gmsh.model.mesh.getElementType("triangle", 1)
gmsh.model.mesh.addElementsByType(s, elementType2D, tagsForTriangles,
    faceNodesForTriangles)

# Since the tags for the triangles have been created based on the face tags,
# the information about neighboring elements can also be readily created,
# useful e.g. in Finite Volume or Discontinuous Galerkin techniques:
for t in tagsForTriangles:
    print("triangle " + str(int(t)) + " is connected to tetrahedra " +
        str(faces2Elements[t - maxElementTag]))

# If all you need is the list of all edges or faces in terms of their nodes, you
# can also directly call:
edgeTags, edgeNodes = gmsh.model.mesh.getAllEdges()
faceTags, faceNodes = gmsh.model.mesh.getAllFaces(3)

# Launch the GUI to see the results:
if '-nopopup' not in sys.argv:
    gmsh.fltk.run()

gmsh.finalize()
Chapter 3: Gmsh graphical user interface

Once you have the Gmsh application installed (see Section 1.7 [Installing and running Gmsh on your computer], page 14), to launch the graphical interface just double-click on the Gmsh icon, or type

```
> gmsh
```
at the shell prompt in a terminal. This will open the main window of the Gmsh GUI, with a menu bar on top (except on macOS, where by default the menu bar is on the top of the screen – this can be changed with the `General.SystemMenuBar` option, see Section 7.1 [General options], page 223), a tree menu on the left (which by default contains a ‘Modules’ entry with three children: ‘Geometry’, ‘Mesh’ and ‘Solver’), a graphic area on the right, and a status bar with some shortcut buttons at the bottom. (You can detach the tree menu using ‘Window- >Attach/Detach Menu’.)

To create a new geometrical model, use the ‘File->New’ menu to create a new model file, and choose for example ‘mymodel.geo’ as file name. Then in the tree menu, successively open the ‘Geometry’, ‘Elementary entities’ and ‘Add’ submenus, and click for example on ‘Rectangle’. A context window with parameters will pop up: you can enter some parameters in this window (e.g. the width and height of the rectangle) and move the mouse to place it on the canvas. If you don’t want to place the rectangle with the mouse, select ‘X’, ‘Y’ and ‘Z freeze’ in the window and enter the coordinates manually in the context window. Once you are done, either press e (see the status message on the top of the graphic window) or click on the ‘Add’ button in the context window.
There is no need to save your geometrical model: when the rectangle was added, scripting commands were automatically appended to your model file ‘mymodel.geo’:

```
//+
SetFactory("OpenCASCADE");
Rectangle(1) = {0, 0, 0, 1, 0.5, 0};
```

You can edit this script with any text editor; clicking on ‘Edit script’ in the tree menu will launch the default text editor specified by the General.Editor option (see Section 7.1 [General options], page 223). If you edit the script, you should click on ‘Reload script’ in the tree menu to reload the modifications in the GUI. The //+ line in the script is a comment that is used as a placemark between commands added by the GUI; see Chapter 5 [Gmsh scripting language], page 91 for the scripting language reference.

Combining GUI actions and script file editing is a classical way of working with the Gmsh app. For example, it is often faster to define variables and points directly in the script file, and then use the GUI to define the curves, the surfaces and the volumes interactively.

To load an existing model instead of creating a model from scratch, use the ‘File->Open’ menu. For example, to open the first tutorial (see Chapter 2 [Gmsh tutorial], page 15), choose t1.geo. On the terminal, you can also specify the file name directly on the command line, i.e.:

```
> gmsh t1.geo
```

To generate a mesh, open ‘Mesh’ in the tree menu and choose the desired dimension: ‘1D’ will mesh all the curves; ‘2D’ will mesh all the surfaces—as well as all the curves if ‘1D’ was not called before; ‘3D’ will mesh all the volumes—and all the surfaces if ‘2D’ was not called before. To save the resulting mesh in the current mesh format click on ‘Save’ in the tree menu, or select the appropriate format and file name with the ‘File->Export’ menu. The default mesh file name is based on the name of the current active model, with an appended extension depending on the mesh format. Note that most interactive commands have keyboard shortcuts: see Section 3.2 [Keyboard shortcuts], page 82, or select ‘Help->Keyboard and Mouse Usage’ in the menu. For example, to quickly generate the 2D mesh and save a mesh, you can first press 2, then Ctrl+Shift+s.

A double-click in the graphic window will pop up a quick shortcut menu, which can be used e.g. to quickly toggle the visibility of mesh entities (like surface faces), reset the viewport, select the rotation center, display axes, or access the full module options (from the ‘Tools->Options’ menu). The shortcut buttons on the bottom left of the status bar can be used to quickly adjust the viewport: ‘X’, ‘Y’, ‘Z’ set viewports with the corresponding axis perpendicular to graphic plane; the rotation button rotates the view by 90 degrees; and ‘1:1’ resets the scale.

```
        File     Tools     Window     Help
        +--------+--------+--------+--------+
        |        |        |        |        |
        |    1    |    2    |    3    |    4    |
        +--------+--------+--------+--------+
        +--------+--------+--------+--------+
```

Several files can be loaded simultaneously. When specified on the command line, the first one defines the active model (in the same way as using the ‘File->Open’ menu) and the others are
‘merged’ into this model (in the same way as using the ‘File->Merge’ menu). For example, to merge the post-processing views contained in the files view1.pos and view5.msh together with the geometry of the first tutorial Section 2.1 [t1], page 15, you can type the following command:

```gmsh t1.geo view1.pos view5.msh```

When one or more more post-processing views are loaded, a ‘Post-Processing’ entry in the tree menu appears. With the previous command, three views will appear in the tree menu under ‘Post-processing’, respectively labeled ‘A scalar map’, ‘Nodal scalar map’ and ‘Element 1 vector’. In this example the views contain several time steps: you can loop through them with the shortcuts icons on the left of the status bar. A mouse click on the view name will toggle the visibility of the selected view, while a click on the arrow button on the right will provide access to the view’s options.

Note that all the options specified interactively can also be directly specified in the script files. You can save the current options of the current active model with the ‘File->Save Model Options’. This will create a new option file with the same filename as the active model, but with an extra '.opt' extension added. The next time you open this model, the associated options will be automatically loaded, too. To save the current options as your default preferences for all future Gmsh sessions, use the ‘File->Save Options As Default’ menu instead. You can also save the current options in an arbitrary file by choosing the ‘Gmsh options’ format in ‘File->Export’.

For more information about available options (and how to reset them to their default values), see Chapter 7 [Gmsh options], page 223. A full list of options with their current values is also available using the ‘Help->Current Options’ menu.

Finally, note that the GUI can also be run (and modified) using the API: see Section 6.14 [Namespace gmsh/fltk], page 212 for details.

The two next sections describe the mouse actions in the GUI, as well as all the predefined keyboard shortcuts. Screencasts explaining how to use the Gmsh GUI are available online at the following address: https://gmsh.info/screencasts/.

### 3.1 Mouse actions

**Move**  
Highlight the entity under the mouse pointer and display its properties / Resize a lasso zoom or a lasso (un)selection

**Left button**  
Rotate / Select an entity / Accept a lasso zoom or a lasso selection

**Ctrl+Left button**  
Start a lasso zoom or a lasso (un)selection

**Middle button**  
Zoom / Unselect an entity / Accept a lasso zoom or a lasso unselection

**Ctrl+Middle button**  
Orthogonalize display

**Right button**  
Pan / Cancel a lasso zoom or a lasso (un)selection / Pop-up menu on post-processing view button

**Ctrl+Right button**  
Reset to default viewpoint

For a 2 button mouse, Middle button = Shift+Left button.

For a 1 button mouse, Middle button = Shift+Left button, Right button = Alt+Left button.
3.2 Keyboard shortcuts

(On macOS, Ctrl is replaced by Cmd in the shortcuts below.)

**Left arrow**
Go to previous time step

**Right arrow**
Go to next time step

**Up arrow**
Make previous view visible

**Down arrow**
Make next view visible

**0**
Reload geometry

**Ctrl+0 or 9**
Reload full project

**1 or F1**
Mesh lines

**2 or F2**
Mesh surfaces

**3 or F3**
Mesh volumes

**Escape**
Cancel lasso zoom/selection, toggle mouse selection ON/OFF

**e**
End/accept selection in geometry creation mode

**g**
Go to geometry module

**m**
Go to mesh module

**p**
Go to post-processing module

**q**
Abort selection in geometry creation mode

**s**
Go to solver module

**x**
Toggle x coordinate freeze in geometry creation mode

**y**
Toggle y coordinate freeze in geometry creation mode

**z**
Toggle z coordinate freeze in geometry creation mode

**Shift+a**
Bring all windows to front

**Shift+g**
Show geometry options

**Shift+m**
Show mesh options

**Shift+o**
Show general options

**Shift+p**
Show post-processing options

**Shift+s**
Show solver options

**Shift+u**
Show post-processing view plugins

**Shift+w**
Show post-processing view options

**Shift+x**
Move only along x coordinate in geometry creation mode

**Shift+y**
Move only along y coordinate in geometry creation mode

**Shift+z**
Move only along z coordinate in geometry creation mode

**Shift+Escape**
Enable full mouse selection
Ctrl+d Attach/detach menu
Ctrl+e Export project
Ctrl+f Enter full screen
Ctrl+i Show statistics window
Ctrl+j Save model options
Ctrl+l Show message console
Ctrl+m Minimize window
Ctrl+n Create new project file
Ctrl+o Open project file
Ctrl+q Quit
Ctrl+r Rename project file
Ctrl+s Save mesh in default format
Shift+Ctrl+c Show clipping plane window
Shift+Ctrl+h Show current options and workspace window
Shift+Ctrl+j Save options as default
Shift+Ctrl+m Show manipulator window
Shift+Ctrl+n Show option window
Shift+Ctrl+o Merge file(s)
Shift+Ctrl+r Open next-to-last opened file
Shift+Ctrl+u Show plugin window
Shift+Ctrl+v Show visibility window
Alt+a Loop through axes modes
Alt+b Hide/show bounding boxes
Alt+c Loop through predefined color schemes
Alt+e Hide/Show element outlines for visible post-pro views
Alt+f Change redraw mode (fast/full)
Alt+h Hide/show all post-processing views
Alt+i Hide/show all post-processing view scales
Alt+l Hide/show geometry lines
Alt+m Toggle visibility of all mesh entities
Alt+n  Hide/show all post-processing view annotations
Alt+o  Change projection mode (orthographic/perspective)
Alt+p  Hide/show geometry points
Alt+r  Loop through range modes for visible post-pro views
Alt+s  Hide/show geometry surfaces
Alt+t  Loop through interval modes for visible post-pro views
Alt+v  Hide/show geometry volumes
Alt+w  Enable/disable all lighting
Alt+x  Set X view
Alt+y  Set Y view
Alt+z  Set Z view
Alt+1  Set 1:1 view

Alt+Shift+a  Hide/show small axes
Alt+Shift+b  Hide/show mesh volume faces
Alt+Shift+c  Loop through predefined colormaps
Alt+Shift+d  Hide/show mesh surface faces
Alt+Shift+1  Hide/show mesh lines
Alt+Shift+p  Hide/show mesh nodes
Alt+Shift+s  Hide/show mesh surface edges
Alt+Shift+t  Same as Alt+t, but with numeric mode included
Alt+Shift+v  Hide/show mesh volume edges
Alt+Shift+x  Set -X view
Alt+Shift+y  Set -Y view
Alt+Shift+z  Set -Z view
Alt+Shift+1  Reset bounding box around visible entities
Alt+Ctrl++1  Sync scale between viewports
4 Gmsh command-line interface

Gmsh defines a number of command-line switches that can be used to control Gmsh in “batch” mode from the command line, and pass options without resorting to a script (see Chapter 5 [Gmsh scripting language], page 91) or the API (see Chapter 6 [Gmsh application programming interface], page 125).

For example, meshing the first tutorial in batch mode can be done in a terminal by passing the -2 command-line switch:

```bash
> gmsh t1.geo -2
```

The same effect could be achieved by adding the Mesh 2; command at the end of ‘t1.geo’ and running

```bash
> gmsh t1.geo -parse_and_exit
```

or further adding the Exit; command at the end of the script and simply opening this new file:

```bash
> gmsh t1.geo
```

Note that all numeric and string options (see Chapter 7 [Gmsh options], page 223) can be set from the command line with the -setnumber and -setstring switches

```bash
> gmsh t1.geo -setnumber Mesh.Nodes 1 -setnumber Geometry.SurfaceLabels 1
```

The list of all command-line switches is given hereafter.

(Related option names, if any, are given between parentheses)

Geometry:

-0          Output model, then exit
-tol value  Set geometrical tolerance (Geometry.Tolerance)
-match      Match geometries and meshes

Mesh:

-1, -2, -3  Perform 1D, 2D or 3D mesh generation, then exit
-format string  Select output mesh format: auto, msh1, msh2, msh22, msh3, msh4, msh40, msh41, msh, unv, vtk, wrl, mail, stl, p3d, mesh, bdf, cgns, med, diff, ir3, inp, ply2, celum, su2, x3d, dat, neu, m, key, off, rad (Mesh.Format)
-bin        Create binary files when possible (Mesh.Binary)
-refine     Perform uniform mesh refinement, then exit
-barycentric_refine  Perform barycentric mesh refinement, then exit
-reclassify angle  Reclassify surface mesh, then exit
-reparam angle   Reparametrize surface mesh, then exit
-part int       Partition after batch mesh generation (Mesh.NbPartitions)
-part_weight [tri,quad,tet,hex,pri,pyr,trihi] int  Weight of a triangle/quad/etc. during partitioning (Mesh.Partition[Tri,Quad,...]Weight)
- **-part_split**
  Save mesh partitions in separate files (Mesh_PartitionSplitMeshFiles)

- **-part_[no_]topo**
  Create the partition topology (Mesh_PartitionCreateTopology)

- **-part_[no_]ghosts**
  Create ghost cells (Mesh_PartitionCreateGhostCells)

- **-part_[no_]physicals**
  Create physical groups for partitions (Mesh_PartitionCreatePhysicals)

- **-part_topo_pro**
  Save the partition topology .pro file (Mesh_PartitionTopologyFile)

- **-preserve_numbering_msh2**
  Preserve element numbering in MSH2 format (Mesh_PreserveNumberingMsh2)

- **-save_all**
  Save all elements (Mesh_SaveAll)

- **-save_parametric**
  Save nodes with their parametric coordinates (Mesh_SaveParametric)

- **-save_topology**
  Save model topology (Mesh_SaveTopology)

- **-algo string**
  Select mesh algorithm: auto, meshadapt, del2d, front2d, delquad, quadqs, initial2d, del3d, front3d, mmg3d, hxt, initial3d (Mesh_Algorithm and Mesh_Algorithm3D)

- **-smooth int**
  Set number of mesh smoothing steps (Mesh_Smoothing)

- **-order int**
  Set mesh order (Mesh_ElementOrder)

- **-optimize[_netgen]**
  Optimize quality of tetrahedral elements (Mesh_Optimize[Netgen])

- **-optimize_threshold**
  Optimize tetrahedral elements that have a quality less than a threshold (Mesh_OptimizeThreshold)

- **-optimize_ho**
  Optimize high order meshes (Mesh_HighOrderOptimize)

- **-ho_[min,max,nlayers]**
  High-order optimization parameters (Mesh_HighOrderThreshold[Min,Max], Mesh_HighOrderNumLayers)

- **-clscale value**
  Set mesh element size factor (Mesh_MeshSizeFactor)

- **-clmin value**
  Set minimum mesh element size (Mesh_MeshSizeMin)

- **-clmax value**
  Set maximum mesh element size (Mesh_MeshSizeMax)

- **-clextend value**
  Extend mesh element sizes from boundaries (Mesh_MeshSizeExtendFromBoundary)
-clcurv value
  Compute mesh element size from curvature, with value the target number of elements per 2*pi radians (Mesh.MeshSizeFromCurvature)

-aniso_max value
  Set maximum anisotropy for bamg (Mesh.AnisoMax)

-smooth_ratio value
  Set smoothing ration between mesh sizes at nodes of a same edge for bamg (Mesh.SmoothRatio)

-epslc1d value
  Set accuracy of evaluation of mesh size field for 1D mesh (Mesh.LcIntegrationPrecision)

-swapangle value
  Set the threshold angle (in degrees) between two adjacent faces below which a swap is allowed (Mesh.AllowSwapAngle)

-rand value
  Set random perturbation factor (Mesh.RandomFactor)

-bgm file
  Load background mesh from file

-check
  Perform various consistency checks on mesh

-ignore_periodicity
  Ignore periodic boundaries (Mesh.IgnorePeriodicity)

Post-processing:

-link int
  Select link mode between views (PostProcessing.Link)

-combine
  Combine views having identical names into multi-time-step views

Solver:

-listen string
  Always listen to incoming connection requests (Solver.AlwaysListen) on the given socket (uses Solver.SocketName if not specified)

-minterpreter string
  Name of Octave interpreter (Solver.OctaveInterpreter)

-pyinterpreter string
  Name of Python interpreter (Solver.OctaveInterpreter)

-run
  Run ONELAB solver(s)

Display:

-n
  Hide all meshes and post-processing views on startup (View.Visible, Mesh.[Points,Lines,SurfaceEdges,...])

-nodb
  Disable double buffering (General.DoubleBuffer)

-numsubedges
  Set num of subdivisions for high order element display (Mesh.NumSubEdges)

-fontsize int
  Specify the font size for the GUI (General.FontSize)

-theme string
  Specify FLTK GUI theme (General.FltkTheme)
-display string
   Specify display (General.Display)
-camera
   Use camera mode view (General.CameraMode)
-stereo
   OpenGL quad-buffered stereo rendering (General.Stereo)
-gamepad
   Use gamepad controller if available

Other:
- -parse_and_exit
   Parse input files, then exit
-save
   Save output file, then exit
-o file
   Specify output file name
-new
   Create new model before merge next file
-merge
   Merge next files
-open
   Open next files
-log filename
   Log all messages to filename
-a, -g, -m, -s, -p
   Start in automatic, geometry, mesh, solver or post-processing mode
   (General.InitialModule)
-pid
   Print process id on stdout
-watch pattern
   Pattern of files to merge as they become available (General.WatchFilePattern)
-bg file
   Load background (image or PDF) file (General.BackgroundImageFileName)
-v int
   Set verbosity level (General.Verbosity)
-string "string"
   Parse command string at startup
-setnumber name value
   Set constant, ONELAB or option number name=value
-setstring name value
   Set constant, ONELAB or option string name=value
-nopopup
   Don’t popup dialog windows in scripts (General.NoPopup)
-noenv
   Don’t modify the environment at startup
-nolocale
   Don’t modify the locale at startup
-option file
   Parse option file at startup
-convert files
   Convert files into latest binary formats, then exit
-nt int
   Set number of threads (General.NumThreads)
-cpu
   Report CPU times for all operations
-version
   Show version number
-info       Show detailed version information
-help       Show command line usage
-help_options
            Show all options
5 Gmsh scripting language

The Gmsh scripting language is interpreted at runtime by Gmsh’s parser. Scripts are written in ASCII files and are usually given the ‘.geo’ extension, but any extension (or no extension at all) can also be used. For example Gmsh often uses the ‘.pos’ extension for scripts that contain post-processing commands, in particular parsed post-processing views (see Section 5.4 [Post-processing scripting commands], page 119).

Historically, ‘.geo’ scripts have been the primary way to perform complex tasks with Gmsh, and they are indeed quite powerful: they can handle (lists of) floating point (see Section 5.1.2 [Floating point expressions], page 91) and string (see Section 5.1.3 [String expressions], page 94) variables, loops and tests (see Section 5.1.8 [Loops and conditionals], page 98), macros (see Section 5.1.7 [User-defined macros], page 98), etc. However Gmsh’s scripting language is still quite limited compared to actual programming languages: for example there are no private variables, macros don’t take arguments, and the runtime interpretation by the parser can penalize performance on large models. Depending on the workflow and the application, using the Gmsh API (see Chapter 6 [Gmsh application programming interface], page 125) can thus sometimes be preferable. The downside of the API is that, while the scripting language is baked into Gmsh and is thus available directly in the standalone Gmsh app, the API requires external dependencies (a C++, C or Fortran compiler; or a Python or Julia interpreter).

This chapter describes the scripting language by detailing general commands first (see Section 5.1 [General scripting commands], page 91), before detailing the scripting commands specific to the geometry (see Section 5.2 [Geometry scripting commands], page 104), mesh (see Section 5.3 [Mesh scripting commands], page 113) and post-processing (see Section 5.4 [Post-processing scripting commands], page 119) modules.

The following rules are used when describing the scripting language in the rest of this chapter (note that metasyntactic variable definitions stay valid throughout the chapter, not only in the section where the definitions appear):

1. Keywords and literal symbols are printed like this.
2. Metasyntactic variables (i.e., text bits that are not part of the syntax, but stand for other text bits) are printed like this.
3. A colon (:) after a metasyntactic variable separates the variable from its definition.
4. Optional rules are enclosed in < > pairs.
5. Multiple choices are separated by |.
6. Three dots (... ) indicate a possible (multiple) repetition of the preceding rule.

5.1 General scripting commands

5.1.1 Comments

Gmsh script files support both C and C++ style comments:

1. any text comprised between /* and */ pairs is ignored;
2. the rest of a line after a double slash // is ignored.

These commands won’t have the described effects inside double quotes or inside keywords. Also note that ‘white space’ (spaces, tabs, new line characters) is ignored inside all expressions.

5.1.2 Floating point expressions

The two constant types used in Gmsh scripts are real and string (there is no integer type). These types have the same meaning and syntax as in the C or C++ programming languages. Floating point expressions (or, more simply, “expressions”) are denoted by the metasyntactic variable expression, and are evaluated during the parsing of the script file:
expression:
  real |
  string |
  string ~ { expression } |
  string [] expression | |
  # string [] |
  ( expression ) | |
  operator-unary-left expression |
  expression operator-unary-right |
  expression operator-binary expression |
  expression operator-ternary-left expression |
  operator-ternary-right expression |
  built-in-function |
  number-option |
  Find(expression-list-item, expression-list-item) |
  StrFind(string-expression, string-expression) |
  StrCmp(string-expression, string-expression) |
  StrLen(string-expression) |
  TextAttributes(string-expression<,string-expression...>) |
  Exists(string) | Exists(string~{ expression }) |
  FileExists(string-expression) |
  StringToName(string-expression) | S2N(string-expression) |
  GetNumber(string-expression <,expression>) |
  GetValue("string", expression) |
  DefineNumber(expression, onelab-options)

Such expressions are used in most of Gmsh’s scripting commands. When \(~\{expression\}\) is appended to a string \(string\), the result is a new string formed by the concatenation of \(string\), \(~\) (an underscore) and the value of the \(expression\). This is most useful in loops (see Section 5.1.8 [Loops and conditionals], page 98), where it permits to define unique strings automatically. For example,

```
For i In {1:3}
  x~{i} = i;
EndFor
```

is the same as

```
x_1 = 1;
x_2 = 2;
x_3 = 3;
```

The brackets [] permit to extract one item from a list (parentheses can also be used instead of brackets). The # permits to get the size of a list. The operators \(operator\-unary\-left\), \(operator\-unary\-right\), \(operator\-binary\), \(operator\-ternary\-left\) and \(operator\-ternary\-right\) are defined in Section 5.1.5 [Operators], page 95. For the definition of \(built\-in\-functions\), see Section 5.1.6 [Built-in functions], page 97. The various \(number\-options\) are listed in Chapter 7 [Gmsh options], page 223. \(Find\) searches for occurrences of the first \(expression\) in the second (both of which can be lists). \(StrFind\) searches the first \(string\-expression\) for any occurrence of the second \(string\-expression\). \(StrCmp\) compares the two \(string\-expression\)s (returns an integer greater than, equal to, or less than 0, according as the first \(string\) is greater than, equal to, or less than the second \(string\)). \(StrLen\) returns the length of the \(string\). \(TextAttributes\) creates attributes for text \(string\-expression\). \(Exists\) checks if a variable with the given name exists (i.e., has been defined previously), and \(FileExists\) checks if the file with the given name exists. \(StringToName\) creates a name from the provided \(string\). \(GetNumber\) allows to get the value of a ONELAB variable (the optional second argument is the default value returned if the variable does not exist). \(GetValue\) allows to ask
the user for a value interactively (the second argument is the value returned in non-interactive mode). For example, inserting `GetValue("Value of parameter alpha?", 5.76)` in an input file will query the user for the value of a certain parameter alpha, assuming the default value is 5.76. If the option `General.NoPopup` is set (see Section 7.1 [General options], page 223), no question is asked and the default value is automatically used.

`DefineNumber` allows to define a ONELAB variable in-line. The expression given as the first argument is the default value; this is followed by the various ONELAB options. See the ONELAB tutorial wiki for more information.

List of expressions are also widely used, and are defined as:

```plaintext
expression-list:
  expression-list-item <, expression-list-item> ...
```

with

```plaintext
expression-list-item:
  expression |
  expression : expression |
  expression : expression : expression |
  string [] | string () |
  List [ string ] |
  List [ expression-list-item ] |
  List [ { expression-list } ] |
  Unique [ expression-list-item ] |
  Abs [ expression-list-item ] |
  ListFromFile [ expression-char ] |
  LinSpace[ expression, expression, expression ] |
  LogSpace[ expression, expression, expression ] |
  string [ { expression-list } ] |
  Point { expression } |
  transform |
  extrude |
  boolean |
  Point|Curve|Surface|Volume In BoundingBox { expression-list } |
  BoundingBox Point|Curve|Surface|Volume { expression-list } |
  Mass Curve|Surface|Volume { expression } |
  CenterOfMass Curve|Surface|Volume { expression } |
  MatrixOfInertia Curve|Surface|Volume { expression } |
  Point { expression } |
  Physical Point|Curve|Surface|Volume { expression-list } |
  <Physical> Point|Curve|Surface|Volume { : } |
```

The second case in this last definition permits to create a list containing the range of numbers comprised between two `expression`s, with a unit incrementation step. The third case also permits to create a list containing the range of numbers comprised between two `expression`s, but with a positive or negative incrementation step equal to the third `expression`. The fourth, fifth and sixth cases permit to reference an expression list (parentheses can also be used instead of brackets). `Unique` sorts the entries in the list and removes all duplicates. `Abs` takes the absolute value of all entries in the list. `ListFromFile` reads a list of numbers from a file. `LinSpace` and `LogSpace` construct lists using linear or logarithmic spacing. The next two cases permit to reference an expression sublist (whose elements are those corresponding to the indices provided by the `expression-list`). The next cases permit to retrieve the indices of entities created through geometrical transformations, extrusions and boolean operations (see Section 5.2.7 [Transformations], page 110, Section 5.2.5 [Extrusions], page 108 and Section 5.2.6 [Boolean operations], page 109).
The next two cases allow to retrieve entities in a given bounding box, or get the bounding box of a given entity, with the bounding box specified as (X min, Y min, Z min, X max, Y max, Z max). Beware that the order of coordinates is different than in the BoundingBox command for the scene: see Section 5.1.9 [Other general commands], page 99. The last cases permit to retrieve the mass, the center of mass or the matrix of inertia of an entity, the coordinates of a given geometry point (see Section 5.2.1 [Points], page 104), the elementary entities making up physical groups, and the tags of all (physical or elementary) points, curves, surfaces or volumes in the model. These operations all trigger a synchronization of the CAD model with the internal Gmsh model.

To see the practical use of such expressions, have a look at the first couple of examples in Chapter 2 [Gmsh tutorial], page 15. Note that, in order to lighten the syntax, you can omit the braces {} enclosing an expression-list if this expression-list only contains a single item. Also note that a braced expression-list can be preceded by a minus sign in order to change the sign of all the expression-list-items.

For some commands it makes sense to specify all the possible expressions in a list. This is achieved with expression-list-or-all, defined as:

```
expression-list-or-all:
  expression-list | :
```

The meaning of “all” (:) depends on context. For example, Curve { : } will get the ids of all the existing curves in the model, while Surface { : } will get the ids of all existing surfaces.

### 5.1.3 String expressions

String expressions are defined as:

```
string-expression:
  "string" |
  string | string[ expression ] |
  Today | OnelabAction | GmshExecutableName |
  CurrentDirectory | CurrentDir | CurrentFileName |
  StrPrefix ( string-expression ) |
  StrRelative ( string-expression ) |
  StrCat ( string-expression <,...> ) |
  Str ( string-expression <,...> ) |
  StrChoice ( expression, string-expression, string-expression ) |
  StrSub( string-expression, expression, expression ) |
  StrSub( string-expression, expression ) |
  UpperCase ( string-expression ) |
  AbsolutePath ( string-expression ) |
  DirName ( string-expression ) |
  Sprintf ( string-expression, expression-list ) |
  Sprintf ( string-expression ) |
  Sprintf ( string-option ) |
  GetEnv ( string-expression ) |
  GetString ( string-expression <,string-expression>) |
  GetStringValue ( string-expression, string-expression ) |
  StrReplace ( string-expression, string-expression, string-expression ) |
  NameToString ( string ) | N2S ( string ) |
  \<Physical> Point|Curve|Surface|Volume { expression } |
  DefineString(string-expression, onelab-options)
```

Today returns the current date. OnelabAction returns the current ONELAB action (e.g. check or compute). GmshExecutableName returns the full path of the Gmsh executable.
CurrentDirectory (or CurrentDir) and CurrentFileName return the directory and file name of the script being parsed. StrPrefix and StrRelative take the prefix (e.g. to remove the extension) or the relative path of a given file name. StrCat and Str concatenate string expressions (Str adds a newline character after each string except the last). StrChoice returns the first or second string-expression depending on the value of expression. StrSub returns the portion of the string that starts at the character position given by the first expression and spans the number of characters given by the second expression or until the end of the string (whichever comes first; or always if the second expression is not provided). UpperCase converts the string-expression to upper case. AbsolutePath returns the absolute path of a file. DirName returns the directory of a file. Sprintf is equivalent to the sprintf C function (where string-expression is a format string that can contain floating point formatting characters: %e, %g, etc.) The various string-options are listed in Chapter 7 [Gmsh options], page 223. GetEnvThe gets the value of an environment variable from the operating system. GetString allows to get a ONELAB string value (the second optional argument is the default value returned if the variable does not exist). GetStringValue asks the user for a value interactively (the second argument is the value used in non-interactive mode). StrReplace’s arguments are: input string, old substring, new substring (brackets can be used instead of parentheses in Str and Sprintf). Physical Point, etc., or Point, etc., retrieve the name of the physical or elementary entity, if any. NameToString converts a variable name into a string.

DefineString allows to define a ONELAB variable in-line. The string-expression given as the first argument is the default value; this is followed by the various ONELAB options. See the ONELAB tutorial wiki for more information.

String expressions are mostly used to specify non-numeric options and input/output file names. See Section 2.8 [t8], page 33, for an interesting usage of string-expressions in an animation script.

List of string expressions are defined as:

\[
\text{string-expression-list:} \\
\text{string-expression <,...>}
\]

5.1.4 Color expressions

Colors expressions are hybrids between fixed-length braced expression-lists and strings:

\[
\text{color-expression:} \\
\text{string-expression |} \\
\text{\{} expression, expression, expression \} | \\
\text{\{} expression, expression, expression, expression \} | \\
\text{color-option}
\]

The first case permits to use the X Windows names to refer to colors, e.g., Red, SpringGreen, LavenderBlush3, … (see src/common/Colors.h in the source code for a complete list). The second case permits to define colors by using three expressions to specify their red, green and blue components (with values comprised between 0 and 255). The third case permits to define colors by using their red, green and blue color components as well as their alpha channel. The last case permits to use the value of a color-option as a color-expression. The various color-options are listed in Chapter 7 [Gmsh options], page 223.

See Section 2.3 [t3], page 21, for an example of the use of color expressions.

5.1.5 Operators

Gmsh’s operators are similar to the corresponding operators in C and C++. Here is the list of available unary, binary and ternary operators.

operator-unary-left:

- Unary minus.
Logical not.

`operator-unary-right`:

`++` Post-incrementation.

`--` Post-decrementation.

`operator-binary`:

`^` Exponentiation.

`*` Multiplication.

`/` Division.

`%` Modulo.

`+` Addition.

`-` Subtraction.

`==` Equality.

`!=` Inequality.

`>` Greater.

`>=` Greater or equality.

`<` Less.

`<=` Less or equality.

`&&` Logical ‘and’.

`||` Logical ‘or’. (Warning: the logical ‘or’ always implies the evaluation of both arguments. That is, unlike in C or C++, the second operand of `||` is evaluated even if the first one is true).

`operator-ternary-left`:

`?`

`operator-ternary-right`:

`:` The only ternary operator, formed by `operator-ternary-left` and `operator-ternary-right`, returns the value of its second argument if the first argument is non-zero; otherwise it returns the value of its third argument.

The evaluation priorities are summarized below\(^1\) (from stronger to weaker, i.e., `*` has a highest evaluation priority than `+`). Parentheses `()` may be used anywhere to change the order of evaluation:

1. `()`, `[]`, `.`, `#`
2. `^`
3. `!`, `++`, `--`, `-` (unary)
4. `*, /, %`
5. `+`, `-`
6. `<`, `>`, `<=`, `>=`
7. `==`, `!=`
8. `&&`
9. `||`
10. `?:`
11. `=`, `+=`, `-=`, `*=`, `/=`

---

\(^1\) The affectation operators are introduced in Section 5.1.9 [Other general commands], page 99.
5.1.6 Built-in functions

A built-in function is composed of an identifier followed by a pair of parentheses containing an expression-list, the list of its arguments. This list of arguments can also be provided in between brackets, instead of parentheses. Here is the list of the built-in functions currently implemented:

**build-in-function:**

Acos ( expression )

Arc cosine (inverse cosine) of an expression in [-1,1]. Returns a value in [0,Pi].

Asin ( expression )

Arc sine (inverse sine) of an expression in [-1,1]. Returns a value in [-Pi/2,Pi/2].

Atan ( expression )

Arc tangent (inverse tangent) of expression. Returns a value in [-Pi/2,Pi/2].

Atan2 ( expression, expression )

Arc tangent (inverse tangent) of the first expression divided by the second. Returns a value in [-Pi,Pi].

Ceil ( expression )

Rounds expression up to the nearest integer.

Cos ( expression )

Cosine of expression.

Cosh ( expression )

Hyperbolic cosine of expression.

Exp ( expression )

Returns the value of e (the base of natural logarithms) raised to the power of expression.

Fabs ( expression )

Absolute value of expression.

Fmod ( expression, expression )

Remainder of the division of the first expression by the second, with the sign of the first.

Floor ( expression )

Rounds expression down to the nearest integer.

Hypot ( expression, expression )

Returns the square root of the sum of the square of its two arguments.

Log ( expression )

Natural logarithm of expression (expression > 0).

Log10 ( expression )

Base 10 logarithm of expression (expression > 0).

Max ( expression, expression )

Maximum of the two arguments.

Min ( expression, expression )

Minimum of the two arguments.

Modulo ( expression, expression )

see Fmod( expression, expression ).

Rand ( expression )

Random number between zero and expression.
Round (expression)
Rounds expression to the nearest integer.

Sqrt (expression)
Square root of expression (expression >= 0).

Sin (expression)
Sine of expression.

Sinh (expression)
Hyperbolic sine of expression.

Tan (expression)
Tangent of expression.

Tanh (expression)
Hyperbolic tangent of expression.

5.1.7 User-defined macros

User-defined macros take no arguments, and are evaluated as if a file containing the macro body was included at the location of the Call statement.

Macro string | string-expression
Begin the declaration of a user-defined macro named string. The body of the macro starts on the line after ‘Macro string’, and can contain any Gmsh command. A synonym for Macro is Function.

Return
End the body of the current user-defined macro. Macro declarations cannot be imbricated.

Call string | string-expression;
Execute the body of a (previously defined) macro named string.

See Section 2.5 [t5], page 26, for an example of a user-defined macro. A shortcoming of Gmsh’s scripting language is that all variables are “public”. Variables defined inside the body of a macro will thus be available outside, too!

5.1.8 Loops and conditionals

Loops and conditionals are defined as follows, and can be imbricated:

For (expression : expression)
Iterate from the value of the first expression to the value of the second expression, with a unit incrementation step. At each iteration, the commands comprised between ‘For (expression : expression)’ and the matching EndFor are executed.

For (expression : expression : expression)
Iterate from the value of the first expression to the value of the second expression, with a positive or negative incrementation step equal to the third expression. At each iteration, the commands comprised between ‘For (expression : expression : expression)’ and the matching EndFor are executed.

For string In {expression : expression}
Iterate from the value of the first expression to the value of the second expression, with a unit incrementation step. At each iteration, the value of the iterate is affected to an expression named string, and the commands comprised between ‘For string In {expression : expression}’ and the matching EndFor are executed.

For string In {expression : expression : expression}
Iterate from the value of the first expression to the value of the second expression, with a positive or negative incrementation step equal to the third expression.
each iteration, the value of the iterate is affected to an expression named string, and
the commands comprised between ‘For string In { expression : expression : 
expression }’ and the matching EndFor are executed.

EndFor   End a matching For command.

If ( expression )
The body enclosed between ‘If ( expression )’ and the matching ElseIf, Else
or EndIf, is evaluated if expression is non-zero.

ElseIf ( expression )
The body enclosed between ‘ElseIf ( expression )’ and the next matching
ElseIf, Else or EndIf, is evaluated if expression is non-zero and none of the ex-
pression of the previous matching codes If and ElseIf were non-zero.

Else   The body enclosed between Else and the matching EndIf is evaluated if none of
the expression of the previous matching codes If and ElseIf were non-zero.

EndIf   End a matching If command.

5.1.9 Other general commands
The following commands can be used anywhere in a Gmsh script:

string = expression;
Create a new expression identifier string, or affects expression to an existing ex-
pression identifier. The following expression identifiers are predefined (hardcoded in
Gmsh’s parser):

Pi       Return 3.1415926535897932.

GMSH_MAJOR_VERSION
Return Gmsh’s major version number.

GMSH_MINOR_VERSION
Return Gmsh’s minor version number.

GMSH_PATCH_VERSION
Return Gmsh’s patch version number.

MPI_Size   Return the number of processors on which Gmsh is running. It is always
1, except if you compiled Gmsh with ENABLE_MPI (see Appendix A
[Compiling the source code], page 373).

MPI_Rank   Return the rank of the current processor.

Cpu       Return the current CPU time (in seconds).

Memory    Return the current memory usage (in Mb).

TotalMemory
Return the total memory available (in Mb).

newp   Return the next available point tag. As explained in Section 1.1 [Ge-
ometry module], page 7, a unique tag must be associated with every
geometrical point: newp permits to know the highest tag already at-
tributed (plus one). This is mostly useful when writing user-defined
macros (see Section 5.1.7 [User-defined macros], page 98) or general ge-
ometric primitives, when one does not know a priori which tags are
already attributed, and which ones are still available.

newc   Return the next available curve tag.
news  Return the next available surface tag.
newv  Return the next available volume tag.
newcl Return the next available curve loop tag.
newsl Return the next available surface loop tag.
newreg Return the next available region tag. That is, newreg returns the maximum of newp, newl, news, newv, newll, newsl and all physical group tags.

string = { }; Create a new expression list identifier string with an empty list.

string[] = { expression-list }; Create a new expression list identifier string with the list expression-list, or affects expression-list to an existing expression list identifier. Parentheses are also allowed instead of square brackets; although not recommended, brackets and parentheses can also be completely omitted.

string [ { expression-list } ] = { expression-list }; Affect each item in the right hand side expression-list to the elements (indexed by the left hand side expression-list) of an existing expression list identifier. The two expression-lists must contain the same number of items. Parentheses can also be used instead of brackets.

string += expression; Add and affect expression to an existing expression identifier.

string -= expression; Subtract and affect expression to an existing expression identifier.

string *= expression; Multiply and affect expression to an existing expression identifier.

string /= expression; Divide and affect expression to an existing expression identifier.

string += { expression-list }; Append expression-list to an existing expression list or creates a new expression list with expression-list.

string -= { expression-list }; Remove the items in expression-list from the existing expression list.

string [ { expression-list } ] += { expression-list }; Add and affect, item per item, the right hand side expression-list to an existing expression list identifier. Parentheses can also be used instead of brackets.

string [ { expression-list } ] -= { expression-list }; Subtract and affect, item per item, the right hand side expression-list to an existing expression list identifier. Parentheses can also be used instead of brackets.

string [ { expression-list } ] *= { expression-list }; Multiply and affect, item per item, the right hand side expression-list to an existing expression list identifier. Parentheses can also be used instead of brackets.

---

2 For compatibility purposes, the behavior of newl, news, newv and newreg can be modified with the Geometry.OldNewReg option (see Section 7.3 [Geometry options], page 250).
Chapter 5: Gmsh scripting language

```
string [ { expression-list } ] /= { expression-list };
   Divide and affect, item per item, the right hand side expression-list to an existing
   expression list identifier. Parentheses can also be used instead of brackets.

string = string-expression;
   Create a new string expression identifier string with a given string-expression.

string[] = Str( string-expression-list ) ;
   Create a new string expression list identifier string with a given string-expression-
   list. Parentheses can also be used instead of brackets.

string[] += Str( string-expression-list ) ;
   Append a string expression list to an existing list. Parentheses can also be used
   instead of brackets.

DefineConstant[ string = expression|string-expression <, ...>] ;
   Create a new expression identifier string, with value expression, only if has not been
   defined before.

DefineConstant[ string = { expression|string-expression, onelab-options } <, ...
   ...>] ;
   Same as the previous case, except that the variable is also exchanged with the
   ONELAB database if it has not been defined before. See the ONELAB tutorial
   wiki for more information.

SetNumber( string-expression , expression ) ;
   Set the value a numeric ONELAB variable string-expression.

SetString( string-expression , string-expression ) ;
   Set the value a string ONELAB variable string-expression.

number-option = expression ;
   Affect expression to a real option.

string-option = string-expression ;
   Affect string-expression to a string option.

color-option = color-expression ;
   Affect color-expression to a color option.

number-option += expression ;
   Add and affect expression to a real option.

number-option -= expression ;
   Subtract and affect expression to a real option.

number-option *= expression ;
   Multiply and affect expression to a real option.

number-option /= expression ;
   Divide and affect expression to a real option.

Abort ;
   Abort the current script.

Exit < expression > ;
   Exit Gmsh (optionally with level expression instead of 0).

CreateDir string-expression ;
   Create the directory string-expression.

Printf( string-expression <, expression-list> ) ;
   Print a string expression in the information window and/or on the terminal. Printf
   is equivalent to the printf C function: string-expression is a format string that can
```
contain formatting characters (%f, %e, etc.). Note that all expressions are evaluated as floating point values in Gmsh (see Section 5.1.2 [Floating point expressions], page 91), so that only valid floating point formatting characters make sense in string-expression. See Section 2.5 [t5], page 26, for an example of the use of Printf.

Printf (string-expression, expression-list) > string-expression;
Same as Printf above, but output the expression in a file.

Printf (string-expression, expression-list) >> string-expression;
Same as Printf above, but appends the expression at the end of the file.

Warning|Error (string-expression <, expression-list>);
Same as Printf, but raises a warning or an error.

Merge string-expression;
Merge a file named string-expression. This command is equivalent to the ‘File->Merge’ menu in the GUI. If the path in string-expression is not absolute, string-expression is appended to the path of the current file. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

ShapeFromFile(string-expression);
Merge a BREP, STEP or IGES file and returns the tags of the highest-dimensional entities. Only available with the OpenCASCADE geometry kernel.

Draw;
Redraw the scene.

SplitCurrentWindowHorizontal expression;
Split the current window horizontally, with the ratio given by expression.

SplitCurrentWindowVertical expression;
Split the current window vertically, with the ratio given by expression.

SetCurrentWindow expression;
Set the current window by specifying its index (starting at 0) in the list of all windows. When new windows are created by splits, new windows are appended at the end of the list.

UnsplitWindow;
Restore a single window.

SetChanged;
Force the mesh and post-processing vertex arrays to be regenerated. Useful e.g. for creating animations with changing clipping planes, etc.

BoundingBox;
Recompute the bounding box of the scene (which is normally computed only after new model entities are added or after files are included or merged). The bounding box is computed as follows:

1. If there is a mesh (i.e., at least one mesh node), the bounding box is taken as the box enclosing all the mesh nodes;
2. If there is no mesh but there is a geometry (i.e., at least one geometrical point), the bounding box is taken as the box enclosing all the geometrical points;
3. If there is no mesh and no geometry, but there are some post-processing views, the bounding box is taken as the box enclosing all the primitives in the views.

This operation triggers a synchronization of the CAD model with the internal Gmsh model.
BoundingBox { expression, expression, expression, expression, expression, expression };  
Force the bounding box of the scene to the given expressions (X min, X max, Y min, Y max, Z min, Z max). Beware that order of the coordinates is different than in the BoundingBox commands for model entities: see Section 5.1.2 [Floating point expressions], page 91.

Delete Model;  
Delete the current model (all model entities and their associated meshes).

Delete Meshes;  
Delete all the meshes in the current model.

Delete Physicals;  
Delete all physical groups.

Delete Variables;  
Delete all the expressions.

Delete Options;  
Delete the current options and revert to the default values.

Delete string;  
Delete the expression string.

Print string-expression;  
Print the graphic window in a file named string-expression, using the current Print.Format (see Section 7.1 [General options], page 223). If the path in string-expression is not absolute, string-expression is appended to the path of the current file. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Sleep expression;  
Suspend the execution of Gmsh during expression seconds.

SystemCall string-expression;  
Executes a (blocking) system call.

NonBlockingSystemCall string-expression;  
Execute a (non-blocking) system call.

OnelabRun ( string-expression <, string-expression > )  
Run a ONELAB client (first argument is the client name, second optional argument is the command line).

SetName string-expression;  
Change the name of the current model.

SetFactory(string-expression);  
Change the current geometry kernel (i.e. determines the CAD kernel that is used for all subsequent geometrical commands). Currently available kernels: "Built-in" and "OpenCASCADE".

SyncModel;  
Force an immediate transfer from the old geometrical database into the new one (this transfer normally occurs right after a file is read).

NewModel;  
Create a new current model.
Include string-expression;

Include the file named string-expression at the current position in the input file. The include command should be given on a line of its own. If the path in string-expression is not absolute, string-expression is appended to the path of the current file.

5.2 Geometry scripting commands

Both the built-in and the OpenCASCADE CAD kernels can be used in the scripting language, by specifying SetFactory("Built-in") or SetFactory("OpenCASCADE"), respectively, before geometrical scripting commands. If SetFactory is not specified, the built-in kernel is used.

A bottom-up boundary representation approach can be used by first defining points (using the Point command), then curves (using Line, Circle, Spline, ..., commands or by extruding points), then surfaces (using for example the Plane Surface or Surface commands, or by extruding curves), and finally volumes (using the Volume command or by extruding surfaces). Entities can then be manipulated in various ways, for example using the Translate, Rotate, Scale or Symmetry commands. They can be deleted with the Delete command, provided that no higher-dimension entity references them. With the OpenCASCADE kernel, additional boolean operations are available: BooleanIntersection, BooleanUnion, BooleanDifference and BooleanFragments.

The next subsections describe all the available geometry commands in the scripting language. Note that the following general rule is followed for the definition of model entities: if an expression defines a new entity, it is enclosed between parentheses. If an expression refers to a previously defined entity, it is enclosed between braces.

5.2.1 Points

Point ( expression ) = { expression, expression, expression <, expression > };

Create a point. The expression inside the parentheses is the point’s tag; the three first expressions inside the braces on the right hand side give the three X, Y and Z coordinates of the point in the three-dimensional Euclidean space; the optional last expression sets the prescribed mesh element size at that point. See Section 1.2.2 [Specifying mesh element sizes], page 10, for more information about how this value is used in the meshing process.

Physical Point ( expression | string-expression <, expression > ) <+|->= { expression-list };

Create a physical point. The expression inside the parentheses is the physical point’s tag; the expression-list on the right hand side should contain the tags of all the elementary points that need to be grouped inside the physical point. If a string-expression is given instead of expression inside the parentheses, a string label is associated with the physical tag, which can be either provided explicitly (after the comma) or not (in which case a unique tag is automatically created).

5.2.2 Curves

Line ( expression ) = { expression, expression };

Create a straight line segment. The expression inside the parentheses is the line segment’s tag; the two expressions inside the braces on the right hand side give tags of the start and end points of the segment.

Bezier ( expression ) = { expression-list };

Create a Bezier curve. The expression-list contains the tags of the control points.
BSpline (expression) = {expression-list};
Create a cubic BSpline. The expression-list contains the tags of the control points. Creates a periodic curve if the first and last points are identical.

Spline (expression) = {expression-list};
Create a spline going through the points in expression-list. With the built-in geometry kernel this constructs a Catmull-Rom spline. With the OpenCASCADE kernel, this constructs a C2 BSpline. Creates a periodic curve if the first and last points are identical.

Circle (expression) = {expression, expression, expression <, ...>};
Create a circle arc. If three expressions are provided on the right-hand-side they define the start point, the center and the end point of the arc. With the built-in geometry kernel the arc should be strictly smaller than Pi. With the OpenCASCADE kernel, if between 4 and 6 expressions are provided, the first three define the coordinates of the center, the next one defines the radius, and the optional next two the start and end angle.

Ellipse (expression) = {expression, expression, expression <, ...>};
Create an ellipse arc. If four expressions are provided on the right-hand-side they define the start point, the center point, a point anywhere on the major axis and the end point. If the first point is a major axis point, the third expression can be omitted. With the OpenCASCADE kernel, if between 5 and 7 expressions are provided, the first three define the coordinates of the center, the next two define the major (along the x-axis) and minor radii (along the y-axis), and the next two the start and end angle. Note that OpenCASCADE does not allow creating ellipse arcs with the major radius smaller than the minor radius.

Compound Spline | BSpline (expression) = {expression-list}; Using expression;
Create a spline or a BSpline from control points sampled on the curves in expression-list. Using expression specifies the number of intervals on each curve to compute the sampling points. Compound splines and BSplines are only available with the built-in geometry kernel.

Curve Loop (expression) = {expression-list};
Create an oriented loop of curves, i.e. a closed wire. The expression inside the parentheses is the curve loop’s tag; the expression-list on the right hand side should contain the tags of all the curves that constitute the curve loop. A curve loop must be a closed loop. With the built-in geometry kernel, the curves should be ordered and oriented, using negative tags to specify reverse orientation. (If the orientation is correct, but the ordering is wrong, Gmsh will actually reorder the list internally to create a consistent loop; the built-in kernel also supports multiple curve loops (or subloops) in a single Curve Loop command, but this is not recommended). With the OpenCASCADE kernel the curve loop is always oriented according to the orientation of its first curve; negative tags can be specified for compatibility with the built-in kernel, but are simply ignored. Curve loops are used to create surfaces: see Section 5.2.3 [Surfaces], page 106.

Wire (expression) = {expression-list};
Create a path made of curves. Wires are only available with the OpenCASCADE kernel. They are used to create ThruSections and extrusions along paths.

Physical Curve (expression | string-expression <, expression> ) <+|->= {expression-list};
Create a physical curve. The expression inside the parentheses is the physical curve’s tag; the expression-list on the right hand side should contain the tags of all the
elementary curves that need to be grouped inside the physical curve. If a string-expression is given instead of expression inside the parentheses, a string label is associated with the physical tag, which can be either provided explicitly (after the comma) or not (in which case a unique tag is automatically created). In some mesh file formats (e.g. MSH2), specifying negative tags in the expression-list will reverse the orientation of the mesh elements belonging to the corresponding elementary curves in the saved mesh file.

5.2.3 Surfaces

Plane Surface (expression) = {expression-list};
Create a plane surface. The expression inside the parentheses is the plane surface’s tag; the expression-list on the right hand side should contain the tags of all the curve loops defining the surface. The first curve loop defines the exterior boundary of the surface; all other curve loops define holes in the surface. A curve loop defining a hole should not have any curves in common with the exterior curve loop (in which case it is not a hole, and the two surfaces should be defined separately). Likewise, a curve loop defining a hole should not have any curves in common with another curve loop defining a hole in the same surface (in which case the two curve loops should be combined).

Surface (expression) = {expression-list} < In Sphere {expression}, Using Point {expression-list} >;
Create a surface filling. With the built-in kernel, the first curve loop should be composed of either three or four curves, the surface is constructed using transfinite interpolation, and the optional In Sphere argument forces the surface to be a spherical patch (the extra parameter gives the tag of the center of the sphere). With the OpenCASCADE kernel, a B-spline surface is constructed by optimization to match the bounding curves, as well as the (optional) points provided after Using Point.

BSpline Surface (expression) = {expression-list};
Create a B-spline surface filling. Only a single curve loop made of 2, 3 or 4 B-spline curves can be provided. BSpline Surface is only available with the OpenCASCADE kernel.

Bezier Surface (expression) = {expression-list};
Create a Bezier surface filling. Only a single curve loop made of 2, 3 or 4 Bezier curves can be provided. Bezier Surface is only available with the OpenCASCADE kernel.

Disk (expression) = {expression-list};
Creates a disk. When four expressions are provided on the right hand side (3 coordinates of the center and the radius), the disk is circular. A fifth expression defines the radius along Y, leading to an ellipse. Disk is only available with the OpenCASCADE kernel.

Rectangle (expression) = {expression-list};
Create a rectangle. The 3 first expressions define the lower-left corner; the next 2 define the width and height. If a 6th expression is provided, it defines a radius to round the rectangle corners. Rectangle is only available with the OpenCASCADE kernel.

Surface Loop (expression) = {expression-list} < Using Sewing >;
Create a surface loop (a shell). The expression inside the parentheses is the surface loop’s tag; the expression-list on the right hand side should contain the tags
of all the surfaces that constitute the surface loop. A surface loop must always represent a closed shell, and the surfaces should be oriented consistently (using negative tags to specify reverse orientation). (Surface loops are used to create volumes: see Section 5.2.4 [Volumes], page 107.) With the OpenCASCADE kernel, the optional Using Sewing argument allows to build a shell made of surfaces that share geometrically identical (but topologically different) curves.

Physical Surface ( expression | string-expression <, expression> ) <+|-=> { expression-list }

Create a physical surface. The expression inside the parentheses is the physical surface’s tag; the expression-list on the right hand side should contain the tags of all the elementary surfaces that need to be grouped inside the physical surface. If a string-expression is given instead instead of expression inside the parentheses, a string label is associated with the physical tag, which can be either provided explicitly (after the comma) or not (in which case a unique tag is automatically created). In some mesh file formats (e.g. MSH2), specifying negative tags in the expression-list will reverse the orientation of the mesh elements belonging to the corresponding elementary surfaces in the saved mesh file.

5.2.4 Volumes

Volume ( expression ) = { expression-list }

Create a volume. The expression inside the parentheses is the volume’s tag; the expression-list on the right hand side should contain the tags of all the surface loops defining the volume. The first surface loop defines the exterior boundary of the volume; all other surface loops define holes in the volume. A surface loop defining a hole should not have any surfaces in common with the exterior surface loop (in which case it is not a hole, and the two volumes should be defined separately). Likewise, a surface loop defining a hole should not have any surfaces in common with another surface loop defining a hole in the same volume (in which case the two surface loops should be combined).

Sphere ( expression ) = { expression-list }

Create a sphere, defined by the 3 coordinates of its center and a radius. Additional expressions define 3 angle limits. The first two optional arguments define the polar angle opening (from \(-\pi/2\) to \(\pi/2\)). The optional ‘angle3’ argument defines the azimuthal opening (from 0 to 2*\(\pi\)). Sphere is only available with the OpenCASCADE kernel.

Box ( expression ) = { expression-list }

Create a box, defined by the 3 coordinates of a point and the 3 extents. Box is only available with the OpenCASCADE kernel.

Cylinder ( expression ) = { expression-list }

Create a cylinder, defined by the 3 coordinates of the center of the first circular face, the 3 components of the vector defining its axis and its radius. An additional expression defines the angular opening. Cylinder is only available with the OpenCASCADE kernel.

Torus ( expression ) = { expression-list }

Create a torus, defined by the 3 coordinates of its center and 2 radii. An additional expression defines the angular opening. Torus is only available with the OpenCASCADE kernel.

Cone ( expression ) = { expression-list }

Create a cone, defined by the 3 coordinates of the center of the first circular face, the 3 components of the vector defining its axis and the two radii of the faces (these
radii can be zero). An additional expression defines the angular opening. \texttt{Cone} is only available with the OpenCASCADE kernel.

\texttt{Wedge ( expression ) = \{ expression-list \};}

Create a right angular wedge, defined by the 3 coordinates of the right-angle point and the 3 extends. An additional parameter defines the top X extent (zero by default). \texttt{Wedge} is only available with the OpenCASCADE kernel.

\texttt{ThruSections ( expression ) = \{ expression-list \};}

Create a volume defined through curve loops. \texttt{ThruSections} is only available with the OpenCASCADE kernel.

\texttt{Ruled ThruSections ( expression ) = \{ expression-list \};}

Same as \texttt{ThruSections}, but the surfaces created on the boundary are forced to be ruled. \texttt{Ruled ThruSections} is only available with the OpenCASCADE kernel.

\texttt{Physical Volume ( expression | string-expression <, expression> ) <+|->= \{ expression-list \};}

Create a physical volume. The \texttt{expression} inside the parentheses is the physical volume’s tag; the \texttt{expression-list} on the right hand side should contain the tags of all the elementary volumes that need to be grouped inside the physical volume. If a \texttt{string-expression} is given instead of \texttt{expression} inside the parentheses, a string label is associated with the physical tag, which can be either provided explicitly (after the comma) or not (in which case a unique tag is automatically created).

### 5.2.5 Extrusions

Curves, surfaces and volumes can also be created through extrusion of points, curves and surfaces, respectively. Here is the syntax of the geometrical extrusion commands (go to Section 5.3.2 [Structured grids], page 113, to see how these commands can be extended in order to also extrude the mesh):

\texttt{extrude:}

\texttt{Extrude \{ expression-list \} \{ extrude-list \}}

Extrude all elementary entities (points, curves or surfaces) in \texttt{extrude-list} using a translation. The \texttt{expression-list} should contain three \texttt{expression}s giving the X, Y and Z components of the translation vector.

\texttt{Extrude \{ \{ expression-list \}, \{ expression-list \}, expression \} \{ extrude-list \}}

Extrude all elementary entities (points, curves or surfaces) in \texttt{extrude-list} using a rotation. The first \texttt{expression-list} should contain three \texttt{expressions} giving the X, Y and Z direction of the rotation axis; the second \texttt{expression-list} should contain three \texttt{expressions} giving the X, Y and Z components of any point on this axis; the last \texttt{expression} should contain the rotation angle (in radians). With the built-in geometry kernel the angle should be strictly smaller than Pi.

\texttt{Extrude \{ \{ expression-list \}, \{ expression-list \}, \{ expression-list \}, expression \} \{ extrude-list \}}

Extrude all elementary entities (points, curves or surfaces) in \texttt{extrude-list} using a translation combined with a rotation (to produce a “twist”). The first \texttt{expression-list} should contain three \texttt{expressions} giving the X, Y and Z components of the translation vector; the second \texttt{expression-list} should contain three \texttt{expressions} giving the X, Y and Z direction of the rotation axis, which should match the direction of the translation; the third \texttt{expression-list} should contain three \texttt{expressions} giving the X, Y and Z components of any point on this axis; the last \texttt{expression} should contain
the rotation angle (in radians). With the built-in geometry kernel the angle should be strictly smaller than Pi.

\textbf{Extrude} \{ extrude-list \}

Extrude entities in \textit{extrude-list} using a translation along their normal. Only available with the built-in geometry kernel.

\textbf{Extrude} \{ extrude-list \} Using Wire \{ expression-list \}

Extrude entities in \textit{extrude-list} along the give wire. Only available with the OpenCASCADE geometry kernel.

\textbf{ThruSections} \{ expression-list \}

Create surfaces through the given curve loops or wires. \textbf{ThruSections} is only available with the OpenCASCADE kernel.

\textbf{Ruled ThruSections} \{ expression-list \}

Create ruled surfaces through the given curve loops or wires. \textbf{Ruled ThruSections} is only available with the OpenCASCADE kernel.

\textbf{Fillet} \{ expression-list \} \{ expression-list \} \{ expression-list \}

Fillet volumes (first list) on some curves (second list), using the provided radii (third list). The radius list can either contain a single radius, as many radii as curves, or twice as many as curves (in which case different radii are provided for the begin and end points of the curves). \textbf{Fillet} is only available with the OpenCASCADE kernel.

\textbf{Chamfer} \{ expression-list \} \{ expression-list \} \{ expression-list \} \{ expression-list \}

Chamfer volumes (first list) on some curves (second list), using the provided distance (fourth list) measured on the given surfaces (third list). The distance list can either contain a single distance, as many distances as curves, or twice as many as curves (in which case the first in each pair is measured on the given corresponding surface). \textbf{Chamfer} is only available with the OpenCASCADE kernel.

\begin{verbatim}
with extrude-list:
   <Physical> Point | Curve | Surface \{ expression-list-or-all \}; ...
\end{verbatim}

As explained in \textbf{Section 5.1.2 [Floating point expressions], page 91}, \textit{extrude} can be used in an expression, in which case it returns a list of tags. By default, the list contains the “top” of the extruded entity at index 0 and the extruded entity at index 1, followed by the “sides” of the extruded entity at indices 2, 3, etc. For example:

\begin{verbatim}
Point(1) = \{0,0,0\};
Point(2) = \{1,0,0\};
Line(1) = \{1, 2\};
out[] = Extrude\{0,1,0\}{ Curve\{1\}; \};
Printf("top curve = %g", out[0]);
Printf("surface = %g", out[1]);
Printf("side curves = %g and %g", out[2], out[3]);
\end{verbatim}

This behaviour can be changed with the \textit{Geometry.ExtrudeReturnLateralEntities} option (see \textbf{Section 7.3 [Geometry options], page 250}).

\subsection{Boolean operations}

Boolean operations can be applied on curves, surfaces and volumes. All boolean operation act on two lists of elementary entities. The first list represents the object; the second represents the tool. The general syntax for boolean operations is as follows:

\begin{verbatim}
boolean:
\end{verbatim}
BooleanIntersection { boolean-list } { boolean-list }
  Compute the intersection of the object and the tool.

BooleanUnion { boolean-list } { boolean-list }
  Compute the union of the object and the tool.

BooleanDifference { boolean-list } { boolean-list }
  Subtract the tool from the object.

BooleanFragments { boolean-list } { boolean-list }
  Compute all the fragments resulting from the intersection of the entities in the object and in the tool, making all interfaces conformal. When applied to entities of different dimensions, the lower dimensional entities will be automatically embedded in the higher dimensional entities if they are not on their boundary.

with

  boolean-list:
  <Physical> Curve | Surface | Volume { expression-list-or-all }; ... |
  Delete ;

If Delete is specified in the boolean-list, the tool and/or the object is deleted.

As explained in Section 5.1.2 [Floating point expressions], page 91, boolean can be used in an expression, in which case it returns the list of tags of the highest dimensional entities created by the boolean operation. See examples/boolean for examples.

An alternative syntax exists for boolean operations, which can be used when it is known beforehand that the operation will result in a single (highest-dimensional) entity:

  boolean-explicit:

  BooleanIntersection ( expression ) = { boolean-list } { boolean-list };
  Compute the intersection of the object and the tool and assign the result the tag expression.

  BooleanUnion ( expression ) = { boolean-list } { boolean-list };
  Compute the union of the object and the tool and assign the result the tag expression.

  BooleanDifference ( expression ) = { boolean-list } { boolean-list };
  Subtract the tool from the object and assign the result the tag expression.

Again, see examples/boolean for examples.

Boolean operations are only available with the OpenCASCADE geometry kernel.

5.2.7 Transformations

Geometrical transformations can be applied to elementary entities, or to copies of elementary entities (using the Duplicata command: see below). The syntax of the transformation commands is:

  transform:

  Dilate { { expression-list }, expression } { transform-list }
  Scale all elementary entities in transform-list by a factor expression. The expression-list should contain three expressions giving the X, Y, and Z coordinates of the center of the homothetic transformation.

  Dilate { { expression-list }, { expression, expression, expression } } { transform-list }
  Scale all elementary entities in transform-list using different factors along X, Y and Z (the three expressions). The expression-list should contain three expressions giving the X, Y, and Z coordinates of the center of the homothetic transformation.
Rotate \{ \{ expression-list \}, \{ expression-list \}, expression \} \{ transform-list \}

Rotate all elementary entities in transform-list by an angle of expression radians. The first expression-list should contain three expressions giving the X, Y and Z direction of the rotation axis; the second expression-list should contain three expressions giving the X, Y and Z components of any point on this axis.

Symmetry \{ expression-list \} \{ transform-list \}

Transform all elementary entities symmetrically to a plane. The expression-list should contain four expressions giving the coefficients of the plane’s equation.

Affine \{ expression-list \} \{ transform-list \}

Apply a 4 x 4 affine transformation matrix (16 entries given by row; only 12 can be provided for convenience) to all elementary entities. Currently only available with the OpenCASCADE kernel.

Translate \{ expression-list \} \{ transform-list \}

Translate all elementary entities in transform-list. The expression-list should contain three expressions giving the X, Y and Z components of the translation vector.

Boundary \{ transform-list \}

(Not a transformation per-se.) Return the entities on the boundary of the elementary entities in transform-list, with signs indicating their orientation in the boundary. To get unsigned tags (e.g. to reuse the output in other commands), apply the \texttt{Abs} function on the returned list. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

CombinedBoundary \{ transform-list \}

(Not a transformation per-se.) Return the boundary of the elementary entities, combined as if a single entity, in transform-list. Useful to compute the boundary of a complex part. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

PointsOf \{ transform-list \}

(Not a transformation per-se.) Return all the geometrical points on the boundary of the elementary entities. Useful to compute the boundary of a complex part. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Intersect Curve \{ expression-list \} Surface \{ expression \}

(Not a transformation per-se.) Return the intersections of the curves given in expression-list with the specified surface. Currently only available with the built-in kernel.

Split Curve \{ expression \} Point \{ expression-list \}

(Not a transformation per-se.) Split the curve expression on the specified control points. Only available with the built-in kernel, for lines, splines and BSplines.

5.2.8 Other geometry commands

Here is a list of all other geometry commands currently available:
Coherence;

Remove all duplicate elementary entities (e.g., points having identical coordinates). Note that with the built-in geometry kernel Gmsh executes the Coherence command automatically after each geometrical transformation, unless Geometry.AutoCoherence is set to zero (see Section 7.3 [Geometry options], page 250). With the OpenCASCADE geometry kernel, Coherence is simply a shortcut for a BooleanFragments operation on all entities, with the Delete operator applied to all operands.

HealShapes;

Apply the shape healing procedure(s), according to Geometry.OCCFixDegenerated, Geometry.OCCFixSmallEdges, Geometry.OCCFixSmallFaces, Geometry.OCCSewFaces, Geometry.OCCMakeSolids. Only available with the OpenCASCADE geometry kernel.

< Recursive > Delete { <Physical> Point | Curve | Surface | Volume { expression-list-or-all }; ... }

Delete all elementary entities whose tags are given in expression-list-or-all. If an entity is linked to another entity (for example, if a point is used as a control point of a curve), Delete has no effect (the curve will have to be deleted before the point can). The Recursive variant deletes the entities as well as all its sub-entities of lower dimension. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Delete Embedded { <Physical> Point | Curve | Surface | Volume { expression-list-or-all }; ... }

Delete all the embedded entities in the elementary entities whose tags are given in expression-list-or-all. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

SetMaxTag Point | Curve | Surface | Volume ( expression )

Force the maximum tag for a category of entities to a given value, so that subsequently created entities in the same category will not have tags smaller than the given value.

< Recursive > Hide { <Physical> Point | Curve | Surface | Volume { expression-list-or-all }; ... }

Hide the entities listed in expression-list-or-all.

Hide { : }

Hide all entities.

< Recursive > Show { <Physical> Point | Curve | Surface | Volume { expression-list-or-all }; ... }

Show the entities listed in expression-list-or-all.

Show { : }

Show all entities.

Sphere | PolarSphere ( expression ) = {expression, expression};

Change the current (surface) geometry used by the built-in geometry kernel to a (polar) sphere, defined by the two point tags specified on the right hand side. The expression between parentheses on the left hand side specifies a new unique tag for this geometry.

Parametric Surface ( expression ) = "string" "string" "string";

Change the current (surface) geometry used by the built-in geometry kernel to a parametric surface defined by the three strings expression evaluating to the x, y and
z coordinates. The expression between parentheses on the left hand side specifies a new unique tag for this geometry.

Coordinates Surface expression;
Change the current (surface) geometry used by the built-in geometry kernel to the geometry identified by the given expression.

Euclidian Coordinates;
Restore the default planar geometry for the built-in geometry kernel.

5.3 Mesh scripting commands

The mesh module scripting commands allow to modify the mesh element sizes and specify structured grid parameters. Certain meshing actions (e.g. “mesh all the surfaces”) can also be specified in the script files, but are usually performed either in the GUI or on the command line (see Chapter 3 [Gmsh graphical user interface], page 79, and Chapter 4 [Gmsh command-line interface], page 85).

5.3.1 Mesh element sizes

Here are the mesh commands that are related to the specification of mesh element sizes:

MeshSize { expression-list } = expression;
Modify the prescribed mesh element size of the points whose tags are listed in expression-list. The new value is given by expression.

Field[expression] = string;
Create a new field (with tag expression), of type string.

Field[expression].string = string-expression | expression | expression-list;
Set the option string of the expression-th field.

Background Field = expression;
Select the expression-th field as the one used to compute element sizes. Only one background field can be given; if you want to combine several field, use the Min or Max field (see below).

5.3.2 Structured grids

Extrude { expression-list } { extrude-list layers }
Extrude both the geometry and the mesh using a translation (see Section 5.2.5 [Extrusions], page 108). The layers option determines how the mesh is extruded and has the following syntax:

layers:
   Layers { expression } | 
   Layers { { expression-list }, { expression-list } } | 
   Recombine < expression >; ... 
   QuadTriNoNewVerts <RecombLateral>; | 
   QuadTriAddVerts <RecombLateral>; ... 

In the first Layers form, expression gives the number of elements to be created in the (single) layer. In the second form, the first expression-list defines how many elements should be created in each extruded layer, and the second expression-list gives the normalized height of each layer (the list should contain a sequence of \( n \) numbers \( 0 < h_1 < h_2 < \ldots < h_n \leq 1 \)). See Section 2.3 [t3], page 21, for an example. For curve extrusions, the Recombine option will recombine triangles into quadrangles when possible. For surface extrusions, the Recombine option will recombine tetrahedra into prisms, hexahedra or pyramids.
Please note that, starting with Gmsh 2.0, region tags cannot be specified explicitly anymore in Layers commands. Instead, as with all other geometry commands, you must use the automatically created entity identifier created by the extrusion command. For example, the following extrusion command will return the tag of the new “top” surface in num[0] and the tag of the new volume in num[1]:

```plaintext
num[] = Extrude {0,0,1} { Surface{1}; Layers{10}; };
```

QuadTriNoNewVerts and QuadTriAddVerts allow to connect structured, extruded volumes containing quadrangle-faced elements to structured or unstructured tetrahedral volumes, by subdividing into triangles any quadrangles on boundary surfaces shared with tetrahedral volumes. (They have no effect for 1D or 2D extrusions.) QuadTriNoNewVerts subdivides any of the region’s quad-faced 3D elements that touch these boundary triangles into pyramids, prisms, or tetrahedra as necessary, all without adding new nodes. QuadTriAddVerts works in a similar way, but subdivides 3D elements touching the boundary triangles by adding a new node inside each element at the node-based centroid. Either method results in a structured extrusion with an outer layer of subdivided elements that interface the inner, unmodified elements to the triangle-meshed region boundaries.

In some rare cases, due to certain lateral boundary conditions, it may not be possible to make a valid element subdivision with QuadTriNoNewVerts without adding additional nodes. In this case, an internal node is created at the node-based centroid of the element. The element is then divided using that node. When an internal node is created with QuadTriNoNewVerts, the user is alerted by a warning message sent for each instance; however, the mesh will still be valid and conformal.

Both QuadTriNoNewVerts and QuadTriAddVerts can be used with the optional RecombLaterals keyword. By default, the QuadTri algorithms will mesh any free laterals as triangles, if possible. RecombLaterals forces any free laterals to remain as quadrangles, if possible. Lateral surfaces between two QuadTri regions will always be meshed as quadrangles.

Note that the QuadTri algorithms will handle all potential meshing conflicts along the lateral surfaces of the extrusion. In other words, QuadTri will not subdivide a lateral that must remain as quadrangles, nor will it leave a lateral as quadrangles if it must be divided. The user should therefore feel free to mix different types of neighboring regions with a QuadTri meshed region; the mesh should work. However, be aware that the top surface of the QuadTri extrusion will always be meshed as triangles, unless it is extruded back onto the original source in a toroidal loop (a case which also works with QuadTri).

QuadTriNoNewVerts and QuadTriAddVerts may be used interchangeably, but QuadTriAddVerts often gives better element quality.

If the user wishes to interface a structured extrusion to a tetrahedral volume without modifying the original structured mesh, the user may create dedicated interface volumes around the structured geometry and apply a QuadTri algorithm to those volumes only.

```
Extrude { { expression-list }, { expression-list }, expression } { extrude-list
layers }
```

Extrude both the geometry and the mesh using a rotation (see Section 5.2.5 [Extrusions], page 108). The layers option is defined as above. With the built-in geometry kernel the angle should be strictly smaller than Pi. With the OpenCASCADE kernel the angle should be strictly smaller than 2 Pi.
Extrude \{ \{ \text{expression-list} \}, \{ \text{expression-list} \}, \{ \text{expression-list} \}, \text{expression} \} \{ \text{extrude-list layers} \}

Extrude both the geometry and the mesh using a combined translation and rotation (see Section 5.2.5 [Extrusions], page 108). The \text{layers} option is defined as above. With the built-in geometry kernel the angle should be strictly smaller than Pi. With the OpenCASCADE kernel the angle should be strictly smaller than 2 Pi.

\text{Extrude} \{ \text{Surface} \{ \text{expression-list} \}; \text{layers} < \text{Using Index}[\text{expr}]; > < \text{Using View}[\text{expr}]; > < \text{ScaleLastLayer}; > \}

Extrude a “topological” boundary layer from the specified surfaces. If no view is specified, the mesh of the boundary layer entities is created using a gouraud-shaded (smoothed) normal field. If a scalar view is specified, it locally prescribes the thickness of the layer. If a vector-valued view is specified it locally prescribes both the extrusion direction and the thickness. Specifying a boundary layer index allows to extrude several independent boundary layers (with independent normal smoothing). \text{ScaleLastLayer} scales the height of the last (top) layer of each normal’s extrusion by the average length of the edges in all the source elements that contain the source node (actually, the average of the averages for each element–edges actually touching the source node are counted twice). This allows the height of the last layer to vary along with the size of the source elements in order to achieve better element quality. For example, in a boundary layer extruded with the Layers definition \{'Layers\{ \{1,4,2\}, \{0.5, 0.6, 1.6\}\}\', a source node adjacent to elements with an overall average edge length of 5.0 will extrude to have a last layer height = (1.6-0.6) * 5.0 = 5.0. Topological boundary layers are only available with the built-in kernel. See \text{sphere\_boundary\_layer.geo} or \text{sphere\_boundary\_layer\_from\_view.geo} for `.geo’ file examples, and \text{aneurysm.py} for an API example.

The advantage of this approach is that it provides a topological description of the boundary layer, which means that it can be connected to other geometrical entities. The disadvantage is that the mesh is just a “simple” extrusion: no fans, no special treatments of reentrant corners, etc. Another boundary layer algorithm is currently available through the \text{BoundaryLayer} field (see Section 1.2.2 [Specifying mesh element sizes], page 10). It only works in 2D however, and is a meshing constraint: it works directly at the mesh level, without creating geometrical entities. See e.g. \text{BL0.geo} or \text{naca12\_2d.geo}.

\text{Transfinite Curve} \{ \text{expression-list-or-all} \} = \text{expression} < \text{Using Progression} | \text{Bump expression} >;

Select the curves in \text{expression-list} to be meshed with the 1D transfinite algorithm. The \text{expression} on the right hand side gives the number of nodes that will be created on the curve (this overrides any other mesh element size prescription—see Section 1.2.2 [Specifying mesh element sizes], page 10). The optional argument \text{‘Using Progression expression’} instructs the transfinite algorithm to distribute the nodes following a geometric progression (\text{Progression 2} meaning for example that each line element in the series will be twice as long as the preceding one). The optional argument \text{‘Using Bump expression’} instructs the transfinite algorithm to distribute the nodes with a refinement at both ends of the curve. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

\text{Transfinite Surface} \{ \text{expression-list-or-all} \} < = \{ \text{expression-list} \} >> \text{Left} | \text{Right} | \text{Alternate} | \text{AlternateRight} | \text{AlternateLeft} >;

Select surfaces to be meshed with the 2D transfinite algorithm. The \text{expression-list} on the right-hand-side should contain the tags of three or four points on the boundary of the surface that define the corners of the transfinite interpolation. If
no tags are given, the transfinite algorithm will try to find the corners automatically. The optional argument specifies the way the triangles are oriented when the mesh is not recombined. _Alternate_ is a synonym for _AlternateRight_. For 3-sided surfaces a specific algorithm can be used to generate structured triangular by setting `Mesh.TransfiniteTri` to 1. Examples can be found in `benchmarks/transfinite`. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

```
Transfinite Volume { expression-list } < = { expression-list } > ;
```

Select five- or six-face volumes to be meshed with the 3D transfinite algorithm. The expression-list on the right-hand-side should contain the tags of the six or eight points on the boundary of the volume that define the corners of the transfinite interpolation. If no tags are given, the transfinite algorithm will try to find the corners automatically. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

```
TransfQuadTri { expression-list } ;
```

Apply the transfinite QuadTri algorithm on the expression-list list of volumes. A transfinite volume with any combination of recombined and un-recombined transfinite boundary surfaces is valid when meshed with `TransfQuadTri`. When applied to non-Transfinite volumes, TransfQuadTri has no effect on those volumes. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

### 5.3.3 Other mesh commands

Here is a list of all other mesh commands currently available:

```
Mesh expression;
```

Generate expression-D mesh. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

```
TransformMesh { expression-list };
```

Transform all the node coordinates in the current mesh using the 4x4 affine transformation matrix given by row (only 12 entries can be provided for convenience).

```
TransformMesh { expression-list } { transform-list };
```

Transform the node coordinates in the current mesh of all the elementary entities in transform-list using the 4x4 affine transformation matrix given by row (only 12 entries can be provided for convenience).

```
RefineMesh;
```

Refine the current mesh by splitting all elements. If `Mesh.SecondOrderLinear` is set, the new nodes are inserted by linear interpolation. Otherwise they are snapped on the actual geometry. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

```
OptimizeMesh string-expression;
```

Optimize the current mesh with the given algorithm (currently "Gmsh" for default tetrahedral mesh optimizer, "Netgen" for Netgen optimizer, "HighOrder" for direct high-order mesh optimizer, "HighOrderElastic" for high-order elastic smoother, "HighOrderFastCurving" for fast curving algorithm, "Laplace2D" for Laplace smoothing, "Relocate2D" and "Relocate3D" for node relocation).

```
AdaptMesh { expression-list } { expression-list } { { expression-list < , ... > } };
```

Perform adaptive mesh generation. Documentation not yet available.
Chapter 5: Gmsh scripting language

RelocateMesh Point | Curve | Surface { expression-list-or-all };
Relocate the mesh nodes on the given entities using the parametric coordinates stored in the nodes. Useful for creating perturbation of meshes e.g. for sensitivity analyzes. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

RecombineMesh;
Recombine the current mesh into quadrangles. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

SetOrder expression;
Change the order of the elements in the current mesh.

PartitionMesh expression;
Partition the mesh into expression, using current partitioning options.

Point | Curve { expression-list } In Surface { expression };
Add a meshing constraint to embed the point(s) or curve(s) in the given surface. The surface mesh will conform to the mesh of the point(s) or curves(s). This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Point | Curve | Surface { expression-list } In Volume { expression };
Add a meshing constraint to embed the point(s), curve(s) or surface(s) in the given volume. The volume mesh will conform to the mesh of the corresponding point(s), curve(s) or surface(s). This is only supported with the 3D Delaunay algorithms. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Periodic Curve { expression-list } = { expression-list };
Add a meshing constraint to force the mesh of the curves on the left-hand side to match the mesh of the curves on the right-hand side (masters). If used after meshing, generate the periodic node correspondence information assuming the mesh of the curves on the left-hand side effectively matches the mesh of the curves on the right-hand side. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Periodic Surface expression { expression-list } = expression { expression-list };
Add a meshing constraint to force the mesh of the surface on the left-hand side (with boundary edges specified between braces) to match the mesh of the master surface on the right-hand side (with boundary edges specified between braces). If used after meshing, generate the periodic node correspondence information assuming the mesh of the surface on the left-hand side effectively matches the mesh of the master surface on the right-hand side (useful for structured and extruded meshes). This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Periodic Curve | Surface { expression-list } = { expression-list } Affine | Translate { expression-list };
Add a meshing constraint to force mesh of curves or surfaces on the left-hand side to match the mesh of the curves or surfaces on the right-hand side (masters), using prescribed geometrical transformations. If used after meshing, generate the periodic node correspondence information assuming the mesh of the curves or surfaces on the left-hand side effectively matches the mesh of the curves or surfaces on the right-hand side (useful for structured and extruded meshes). Affine takes a 4 x 4 affine transformation matrix given by row (only 12 entries can be provided for convenience); Translate takes the 3 components of the translation as in Section 5.2.7 [Transformations], page 110. This operation triggers a synchronization of the CAD model with the internal Gmsh model.
Periodic Curve | Surface \{ expression-list \} = \{ expression-list \} Rotate \{ expression-list \}, \{ expression-list \}, expression ;

Add a meshing constraint to force the mesh of curves or surfaces on the left-hand side to match the mesh of the curves on the right-hand side (masters), using a rotation specified as in Section 5.2.7 [Transformations], page 110. If used after meshing, generate the periodic node correspondence information assuming the mesh of the curves or surfaces on the left-hand side effectively matches the mesh of the curves or surfaces on the right-hand side (useful for structured and extruded meshes). This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Coherence Mesh;

Remove all duplicate mesh nodes in the current mesh.

CreateTopology \{ expression , expression \} ;

Create a boundary representation from the mesh of the current model if the model does not have one (e.g. when imported from mesh file formats with no BRep representation of the underlying model). If the first optional argument is set (or not given), make all volumes and surfaces simply connected first; if the second optional argument is set (or not given), clear any built-in CAD kernel entities and export the discrete entities in the built-in CAD kernel.

CreateGeometry \{ \{<Physical> Point | Curve | Surface | Volume \{ expression-list-or-all \}; . . . \} \} ;

Create a geometry for discrete entities (represented solely by a mesh, without an underlying CAD description) in the current model, i.e. create a parametrization for discrete curves and surfaces, assuming that each can be parametrized with a single map. If no entities are given, create a geometry for all discrete entities.

ClassifySurfaces \{ expression , expression , expression < , expression > \};

Classify ("color") the current surface mesh based on an angle threshold (the first argument, in radians), and create new discrete surfaces, curves and points accordingly. If the second argument is set, also create discrete curves on the boundary if the surface is open. If the third argument is set, create edges and surfaces than can be reparametrized with CreateGeometry. The last optional argument sets an angle threshold to force splitting of the generated curves.

RenumberMeshNodes;

Renumber the node tags in the current mesh in a continuous sequence.

RenumberMeshElements;

Renumber the elements tags in the current mesh in a continuous sequence.

< Recursive > Color color-expression \{ \{<Physical> Point | Curve | Surface | Volume \{ expression-list-or-all \}; . . . \} \}

Set the mesh color of the entities in expression-list to color-expression. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Recombine Surface \{ expression-list-or-all \} = expression ;

Recombine the triangular meshes of the surfaces listed in expression-list into mixed triangular/quadrangular meshes. The optional expression on the right hand side specifies the maximum difference (in degrees) allowed between the largest angle of a quadrangle and a right angle (a value of 0 would only accept quadrangles with right angles; a value of 90 would allow degenerate quadrangles; default value is 45). This operation triggers a synchronization of the CAD model with the internal Gmsh model.
MeshAlgorithm Surface \{ expression-list \} = expression;
Specify the meshing algorithm for the surfaces expression-list.

MeshSizeFromBoundary Surface \{ expression-list \} = expression;
Force the mesh size to be extended from the boundary (or not, depending on the value of expression) for the surfaces expression-list.

Compound Curve | Surface \{ expression-list-or-all \};
Treat the given entities as a single entity when meshing, i.e. perform cross-patch meshing of the entities.

ReverseMesh Curve | Surface \{ expression-list-or-all \};
Add a constraint to reverse the orientation of the mesh of the given curve(s) or surface(s) during meshing. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

ReorientMesh Volume \{ expression-list \};
Add a constraint to reorient the meshes (during mesh generation) of the bounding surfaces of the given volumes so that the normals point outward to the volumes; and if a mesh already exists, reorient it. Currently only available with the OpenCASCADE kernel, as it relies on the STL triangulation. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Save string-expression;
Save the current mesh in a file named string-expression, using the current Mesh.Format (see Section 7.4 [Mesh options], page 259). If the path in string-expression is not absolute, string-expression is appended to the path of the current file. This operation triggers a synchronization of the CAD model with the internal Gmsh model.

SmotherSurface \{ expression-list \} = expression;
Set the number of elliptic smoothing steps for the surfaces listed in expression-list (smoothing only applies to transfinite meshes at the moment). This operation triggers a synchronization of the CAD model with the internal Gmsh model.

Homology \{ \{ expression-list \} \} \{ \{ expression-list \} , \{ expression-list \} \};
Compute a basis representation for homology spaces after a mesh has been generated. The first expression-list is a list of dimensions whose homology bases are computed; if empty, all bases are computed. The second expression-list is a list physical groups that constitute the computation domain; if empty, the whole mesh is the domain. The third expression-list is a list of physical groups that constitute the relative subdomain of relative homology computation; if empty, absolute homology is computed. Resulting basis representation chains are stored as physical groups in the mesh.

Cohomology \{ \{ expression-list \} \} \{ \{ expression-list \} , \{ expression-list \} \};
Similar to command Homology, but computes a basis representation for cohomology spaces instead.

5.4 Post-processing scripting commands
Here is the list of available post-processing scripting commands.

Alias View[expression];
Create an alias of the expression-th post-processing view.
Note that Alias creates a logical duplicate of the view without actually duplicating the data in memory. This is very useful when you want multiple simultaneous
renderings of the same large dataset (usually with different display options), but you cannot afford to store all copies in memory. If what you really want is multiple physical copies of the data, just merge the file containing the post-processing view multiple times.

\texttt{AliasWithOptions View[expression];}
Create an alias of the \textit{expression}-th post-processing view and copies all the options of the \textit{expression}-th view to the new aliased view.

\texttt{CopyOptions View[expression, expression];}
Copy all the options from the first \textit{expression}-th post-processing view to the second one.

\texttt{Combine ElementsByViewName;}
Combine all the post-processing views having the same name into new views. The combination is done “spatially”, i.e., simply by appending the elements at the end of the new views.

\texttt{Combine ElementsFromAllViews | Combine Views;}
Combine all the post-processing views into a single new view. The combination is done “spatially”, i.e., simply by appending the elements at the end of the new view.

\texttt{Combine ElementsFromVisibleViews;}
Combine all the visible post-processing views into a single new view. The combination is done “spatially”, i.e., simply by appending the elements at the end of the new view.

\texttt{Combine TimeStepsByViewName | Combine TimeSteps;}
Combine the data from all the post-processing views having the same name into new multi-time-step views. The combination is done “temporally”, i.e., as if the data in each view corresponds to a different time instant. The combination will fail if the meshes in all the views are not identical.

\texttt{Combine TimeStepsFromAllViews;}
Combine the data from all the post-processing views into a new multi-time-step view. The combination is done “temporally”, i.e., as if the data in each view corresponds to a different time instant. The combination will fail if the meshes in all the views are not identical.

\texttt{Combine TimeStepsFromVisibleViews;}
Combine the data from all the visible post-processing views into a new multi-time-step view. The combination is done “temporally”, i.e., as if the data in each view corresponds to a different time instant. The combination will fail if the meshes in all the views are not identical.

\texttt{Delete View[expression];}
Delete (remove) the \textit{expression}-th post-processing view. Note that post-processing view indices start at 0.

\texttt{Delete Empty Views;}
Delete (remove) all the empty post-processing views.

\texttt{Background Mesh View[expression];}
Apply the \textit{expression}-th post-processing view as the current background mesh. Note that post-processing view indices start at 0.

\texttt{Plugin (string) . Run;}
Execute the plugin \textit{string}. The list of default plugins is given in Chapter 9 [Gmsh plugins], page 321.
Plugin (string). string = expression | string-expression;

Set an option for a given plugin. See Chapter 9 [Gmsh plugins], page 321, for a list of default plugins and Section 2.9 [t9], page 36, for some examples.

Save View[expression] string-expression;

Save the expression-th post-processing view in a file named string-expression. If the path in string-expression is not absolute, string-expression is appended to the path of the current file.

SendToServer View[expression] string-expression;

Send the expression-th post-processing view to the ONELAB server, with parameter name string-expression.

View "string" { string < ( expression-list ) > { expression-list }; ... };

Create a new post-processing view, named "string". This is an easy and quite powerful way to import post-processing data: all the values are expressions, you can embed datasets directly into your geometrical descriptions (see, e.g., Section 2.4 [t4], page 23), the data can be easily generated “on-the-fly” (there is no header containing a priori information on the size of the dataset). The syntax is also very permissive, which makes it ideal for testing purposes.

However this “parsed format” is read by Gmsh’s script parser, which makes it inefficient if there are many elements in the dataset. Also, there is no connectivity information in parsed views and all the elements are independent (all fields can be discontinuous), so a lot of information can be duplicated. For large datasets, you should thus use the mesh-based post-processing file format described in Chapter 10 [Gmsh file formats], page 349, or use one of the standard formats like MED.

More explicitly, the syntax for a parsed View is the following

View "string" {
  type ( coordinates ) { values }; ... 
  < TIME { expression-list }; >
  < INTERPOLATION_SCHEME { val-coef-matrix }
    { val-exp-matrix }
    < { geo-coef-matrix } { geo-exp-matrix } > ; >
};

where the 47 object types that can be displayed are:

<table>
<thead>
<tr>
<th>type</th>
<th>#coordinates</th>
<th>#values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scalar point</td>
<td>SP 3</td>
<td>1 * nb-time-steps</td>
</tr>
<tr>
<td>Vector point</td>
<td>VP 3</td>
<td>3 * nb-time-steps</td>
</tr>
<tr>
<td>Tensor point</td>
<td>TP 3</td>
<td>9 * nb-time-steps</td>
</tr>
<tr>
<td>Scalar line</td>
<td>SL 6</td>
<td>2 * nb-time-steps</td>
</tr>
<tr>
<td>Vector line</td>
<td>VL 6</td>
<td>6 * nb-time-steps</td>
</tr>
<tr>
<td>Tensor line</td>
<td>TL 6</td>
<td>18 * nb-time-steps</td>
</tr>
<tr>
<td>Scalar triangle</td>
<td>ST 9</td>
<td>3 * nb-time-steps</td>
</tr>
<tr>
<td>Vector triangle</td>
<td>VT 9</td>
<td>9 * nb-time-steps</td>
</tr>
<tr>
<td>Tensor triangle</td>
<td>TT 9</td>
<td>27 * nb-time-steps</td>
</tr>
<tr>
<td>Scalar quadrangle</td>
<td>SQ 12</td>
<td>4 * nb-time-steps</td>
</tr>
<tr>
<td>Vector quadrangle</td>
<td>VQ 12</td>
<td>12 * nb-time-steps</td>
</tr>
<tr>
<td>Tensor quadrangle</td>
<td>TQ 12</td>
<td>36 * nb-time-steps</td>
</tr>
<tr>
<td>Scalar tetrahedron</td>
<td>SS 12</td>
<td>4 * nb-time-steps</td>
</tr>
<tr>
<td>Vector tetrahedron</td>
<td>VS 12</td>
<td>12 * nb-time-steps</td>
</tr>
<tr>
<td>Tensor tetrahedron</td>
<td>TS 12</td>
<td>36 * nb-time-steps</td>
</tr>
<tr>
<td>Scalar hexahedron</td>
<td>SH 24</td>
<td>8 * nb-time-steps</td>
</tr>
</tbody>
</table>
The coordinates are given ‘by node’, i.e.,

- \((\text{coord}1, \text{coord}2, \text{coord}3)\) for a point,
- \((\text{coord}1\text{-node}1, \text{coord}2\text{-node}1, \text{coord}3\text{-node}1,\)
  \((\text{coord}1\text{-node}2, \text{coord}2\text{-node}2, \text{coord}3\text{-node}2)\) for a line,
- \((\text{coord}1\text{-node}1, \text{coord}2\text{-node}1, \text{coord}3\text{-node}1,\)
  \((\text{coord}1\text{-node}2, \text{coord}2\text{-node}2, \text{coord}3\text{-node}2,\)
  \((\text{coord}1\text{-node}3, \text{coord}2\text{-node}3, \text{coord}3\text{-node}3)\) for a triangle,
- etc.

The ordering of the nodes is given in Section 10.2 [Node ordering], page 356.

The values are given by time step, by node and by component, i.e.:

\[
\text{comp1-node1\text{-time}1, comp2-node1\text{-time}1, comp3-node1\text{-time}1,}
\text{comp1-node2\text{-time}1, comp2-node2\text{-time}1, comp3-node2\text{-time}1,}
\text{comp1-node3\text{-time}1, comp2-node3\text{-time}1, comp3-node3\text{-time}1,}
\text{comp1-node1\text{-time}2, comp2-node1\text{-time}2, comp3-node1\text{-time}2,}
\text{comp1-node2\text{-time}2, comp2-node2\text{-time}2, comp3-node2\text{-time}2,}
\text{comp1-node3\text{-time}2, comp2-node3\text{-time}2, comp3-node3\text{-time}2,}
\ldots
\]

For the 2D text objects, the two first expressions in coordinates give the X-Y position of the string in screen coordinates, measured from the top-left corner of the window. If the first (respectively second) expression is negative, the position is measured from the right (respectively bottom) edge of the window. If the value of the first (respectively second) expression is larger than 99999, the string is centered horizontally (respectively vertically). If the third expression is equal to zero, the text is aligned bottom-left and displayed using the default font and size. Otherwise, the third expression is converted into an integer whose eight lower bits give the font size, whose eight next bits select the font (the index corresponds to the position in the font menu in the GUI), and whose eight next bits define the text alignment (0=bottom-left, 1=bottom-center, 2=bottom-right, 3=top-left, 4=top-center, 5=top-right, 6=center-left, 7=center-center, 8=center-right).

For the 3D text objects, the three first expressions in coordinates give the XYZ position of the string in model (real world) coordinates. The fourth expression has the same meaning as the third expression in 2D text objects.

For both 2D and 3D text objects, the values can contain an arbitrary number of string-expressions. If the string-expression starts with file://, the remainder of the string is interpreted as the name of an image file, and the image is displayed instead of the string. A format string in the form @wxh or @wxh,wx,wy,wz,hx,hy,hz, where \(w\) and \(h\) are the width and height (in model coordinates for T3 or in pixels for T2) of the image, \(wx,wy,wz\) is the direction of the bottom edge of the image and \(hx,hy,hz\) is the direction of the left edge of the image.
The optional `TIME` list can contain a list of expressions giving the value of the time (or any other variable) for which an evolution was saved.

The optional `INTERPOLATION_SCHEME` lists can contain the interpolation matrices used for high-order adaptive visualization.

Let us assume that the approximation of the view’s value over an element is written as a linear combination of $d$ basis functions $f[i]$, $i=0, ..., d-1$ (the coefficients being stored in `values`). Defining $f[i] = \sum(j=0, ..., d-1) F[i][j] p[j]$, with $p[j] = u^P[j][0] v^P[j][1] w^P[j][2]$ ($u$, $v$ and $w$ being the coordinates in the element’s parameter space), then `val-coef-matrix` denotes the $d \times d$ matrix $F$ and `val-exp-matrix` denotes the $d \times 3$ matrix $P$.

In the same way, let us also assume that the coordinates $x$, $y$ and $z$ of the element are obtained through a geometrical mapping from parameter space as a linear combination of $m$ basis functions $g[i]$, $i=0, ..., m-1$ (the coefficients being stored in `coordinates`). Defining $g[i] = \sum(j=0, ..., m-1) G[i][j] q[j]$, with $q[j] = u^Q[j][0] v^Q[j][1] w^Q[j][2]$, then `geo-coef-matrix` denotes the $m \times m$ matrix $G$ and `geo-exp-matrix` denotes the $m \times 3$ matrix $Q$.

Here are for example the interpolation matrices for a first order quadrangle:

```
INTERPOLATION_SCHEME
{
    {1/4,-1/4, 1/4,-1/4},
    {1/4, 1/4,-1/4,-1/4},
    {1/4, 1/4, 1/4, 1/4},
    {1/4,-1/4,-1/4, 1/4}
}
{
    {0, 0, 0},
    {1, 0, 0},
    {0, 1, 0},
    {1, 1, 0}
};
```
6 Gmsh application programming interface

The Gmsh application programming interface (API) allows to integrate the Gmsh library in external applications written in C++, C, Python, Julia or Fortran. By design, the Gmsh API is purely functional, and only uses elementary types from the target languages. See the tutorials/c++, tutorials/c, tutorials/python, tutorials/julia and tutorials/fortran directories from the Chapter 2 [Gmsh tutorial], page 15 for examples. For other API examples, see the examples/api directory.

The different versions of the API are generated automatically from the master API definition file api.gen.py:

- C++ API: gmsh.h
- C API: gmshc.h
- Python API: gmsh.py
- Julia API: gmsh.jl
- Fortran API: gmsh.f90

The additional gmsh.h_cwrap header redefines the C++ API in terms of the C API. This is provided as a convenience for users of the binary Gmsh Software Development Kit (SDK) whose C++ compiler Application Binary Interface (ABI) is not compatible with the ABI of the C++ compiler used to create the SDK. To use these C++ bindings of the C API instead of the native C++ API, simply rename gmsh.h_cwrap as gmsh.h. Note that this will lead to (slightly) reduced performance compared to using the native Gmsh C++ API, as it entails additional data copies between the C++ wrapper, the C API and the native C++ code.

The structure of the API reflects the underlying Gmsh data model (see also Section B.1 [Source code structure], page 377):

- There are two main data containers: models (which hold the geometrical and the mesh data) and views (which hold post-processing data). These are manipulated by the API functions in the top-level namespaces gmsh/model and gmsh/view, respectively. The other top-level namespaces are gmsh/option (which handles all options), gmsh/plugin (which handles extensions to core Gmsh functionality), gmsh/graphics (which handles drawing), gmsh/fltk (which handles the graphical user interface), gmsh/parser (which handles the Gmsh parser), gmsh/onelab (which handles ONELAB parameters and communications with external codes) and gmsh/logger (which handles information logging).

- Geometrical data is made of model entities, called points (entities of dimension 0), curves (entities of dimension 1), surfaces (entities of dimension 2) or volumes (entities of dimension 3). Model entities are stored using a boundary representation: a volume is bounded by a set of surfaces, a surface is bounded by a series of curves, and a curve is bounded by two end points. Volumes and surfaces can also store embedded entities of lower dimension, to force a subsequent mesh to be conformal to internal features like a point in the middle of a surface. Model entities are identified by a pair of integers: their dimension dim (0, 1, 2 or 3) and their tag, a strictly positive identification number. When dealing with multiple geometrical entities of possibly different dimensions, the API packs them as a vector of (dim, tag) integer pairs. Physical groups are collections of model entities and are also identified by their dimension and by a tag. Operations which do not directly reference a model are performed on the current model.

- Model entities can be either CAD entities (from the built-in geo kernel or from the OpenCASCADE occ kernel) or discrete entities (defined by a mesh). Operations on CAD entities are performed directly within their respective CAD kernels (i.e. using functions from the gmsh/model/geo or gmsh/model/occ namespaces, respectively), as Gmsh does not translate across CAD formats but rather directly accesses the native representation. CAD entities
must be \textit{synchronized} with the model in order to be meshed, or, more generally, for functions outside of \texttt{gmsh/model/geo} or \texttt{gmsh/model/occ} to manipulate them. 1D and 2D meshing algorithms use the \textit{parametrization} of the underlying geometrical curve or surface to generate the mesh. Discrete entities can be remeshed provided that a parametrization is explicitly recomputed for them.

- Mesh data is made of \textit{elements} (points, lines, triangles, quadrangles, tetrahedra, hexahedra, prisms, pyramids, ...), defined by an ordered list of their \textit{nodes}. Elements and nodes are identified by \textit{tags} (strictly positive identification numbers), and are stored \textit{(classified)} in the model entity they discretize. Once meshed, a model entity of dimension 0 (a geometrical point) will thus contain a mesh element of type point (MSH type 15: cf. Section 10.1 \textit{[MSH file format]}, page 349), as well as a mesh node. A model curve will contain line elements (e.g. of MSH type 1 or 8 for first order or second order meshes, respectively) as well as its interior nodes, while its boundary nodes will be stored in the bounding model points. A model surface will contain triangular and/or quadrangular elements and all the nodes not classified on its boundary or on its embedded entities (curves and points). A model volume will contain tetrahedra, hexahedra, etc. and all the nodes not classified on its boundary or on its embedded entities (surfaces, curves and points). This data model allows to easily and efficiently handle the creation, modification and destruction of conformal meshes. All the mesh-related functions are provided in the \texttt{gmsh/model/mesh} namespace.

- Post-processing data is made of \textit{views}. Each view is identified by a \textit{tag}, and can also be accessed by its \textit{index} (which can change when views are sorted, added or deleted). A view stores both display \textit{options} and \textit{data}, unless the view is an \textit{alias} of another view (in which case it only stores display options, and the data points to a reference view). View data can contain several \textit{steps} (e.g. to store time series) and can be either linked to one or more models\(^1\) \textit{(mesh-based) data, as stored in MSH files: cf. Section 10.1 \textit{[MSH file format]}, page 349) or independent from any model \textit{(list-based) data, as stored in parsed POS files: cf. Section 5.4 \textit{[Post-processing scripting commands]}, page 119). Various \textit{plugins} exist to modify and create views.

All the functions available in the API are given below. See the relevant header/module file for the exact definition in each supported language: in \texttt{C++} \texttt{gmsh/model/geo/addPoint} will lead to a namespaced function \texttt{gmsh::model::geo::addPoint}, while in Python and Julia it will lead to \texttt{gmsh.model.geo.addPoint}, in \texttt{C} to \texttt{gmshModelGeoAddPoint} and in \texttt{Fortran} to \texttt{gmsh%model%geo%addPoint}. In addition to the default "camelCase" function names, the Python and Julia APIs also define "snake case" aliases, i.e. \texttt{gmsh.model.geo.add_point}, as this is the recommended style in these languages. Output values are passed by reference in \texttt{C++}, as pointers in \texttt{C} and directly returned (after the return value, if any) in Python and Julia.

### 6.1 Namespace gmsh: top-level functions

\texttt{gmsh/initialize}

Initialize the Gmsh API. This must be called before any call to the other functions in the API. If \texttt{argc} and \texttt{argv} (or just \texttt{argv} in Python or Julia) are provided, they will be handled in the same way as the command line arguments in the Gmsh app. If \texttt{readConfigFiles} is set, read system Gmsh configuration files (\texttt{gmshrc} and \texttt{gmsh-options}). If \texttt{run} is set, run in the same way as the Gmsh app, either interactively or in batch mode depending on the command line arguments. If \texttt{run} is not set, initializing the API sets the options "General.AbortOnError" to 2 and "General.Terminal" to 1.

\(^1\) Each step can be linked to a different model, which allows to have a single time series based on multiple (e.g. deforming or moving) meshes.
Input: \((\text{argc} = 0), \text{argv} = \[]\) (command line arguments), \text{readConfigFiles} = \text{True} (boolean), \text{run} = \text{False} (boolean)

Output: -

Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t1.cpp, t2.cpp, t3.cpp, t4.cpp, t5.cpp, ...), Python (t1.py, t2.py, t3.py, t4.py, t5.py, ...)

\text{gmsh/isInitialized}
Return 1 if the Gmsh API is initialized, and 0 if not.

Input: -

Output: -

Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t1.cpp, t2.cpp, t3.cpp, t4.cpp, t5.cpp, ...), Python (t1.py, t2.py, t3.py, t4.py, t5.py, ...)

\text{gmsh/finalize}
Finalize the Gmsh API. This must be called when you are done using the Gmsh API.

Input: -

Output: -

Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t1.cpp, t2.cpp, t3.cpp, t4.cpp, t5.cpp, ...), Python (t1.py, t2.py, t3.py, t4.py, t5.py, ...)

\text{gmsh/open}
Open a file. Equivalent to the File->Open menu in the Gmsh app. Handling of the file depends on its extension and/or its contents: opening a file with model data will create a new model.

Input: \text{fileName} (string)

Output: -

Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (x1.cpp), Python (x1.py, explore.py, flatten2.py, flatten.py, heal.py, ...)

\text{gmsh/merge}
Merge a file. Equivalent to the File->Merge menu in the Gmsh app. Handling of the file depends on its extension and/or its contents. Merging a file with model data will add the data to the current model.

Input: \text{fileName} (string)
Output: -
Return: -

Language-specific definition:
   C++, C, Python, Julia

Examples: C++ (t7.cpp, t8.cpp, t9.cpp, t13.cpp, t17.cpp), Python (t7.py, t8.py, t9.py, t13.py, t17.py, ...)

**gmsh/write**

Write a file. The export format is determined by the file extension.

Input:  fileName (string)
Output: -
Return: -

Language-specific definition:
   C++, C, Python, Julia

Examples: C++ (t1.cpp, t2.cpp, t3.cpp, t4.cpp, t5.cpp, ...), Python (t1.py, t2.py, t3.py, t4.py, t5.py, ...)

**gmsh/clear**

Clear all loaded models and post-processing data, and add a new empty model.

Input: -
Output: -
Return: -

Language-specific definition:
   C++, C, Python, Julia

Examples: C++ (t3.cpp, x1.cpp), Python (t3.py, t13.py, x1.py, x3d_export.py)

### 6.2 Namespace `gmsh/option`: option handling functions

**gmsh/option/setNumber**

Set a numerical option to value. name is of the form "Category.Option" or "Category[num].Option". Available categories and options are listed in the "Gmsh options" chapter of the Gmsh reference manual.

Input:  name (string), value (double)
Output: -
Return: -

Language-specific definition:
   C++, C, Python, Julia

Examples: C++ (t3.cpp, t5.cpp, t6.cpp, t7.cpp, t8.cpp, ...), Python (t3.py, t5.py, t6.py, t7.py, t8.py, ...)

**gmsh/option/getNumber**

Get the value of a numerical option. name is of the form "Category.Option" or "Category[num].Option". Available categories and options are listed in the "Gmsh options" chapter of the Gmsh reference manual.

Input:  name (string)
gmsh/option/setString
Set a string option to value. name is of the form "Category.Option" or "Category[num].Option". Available categories and options are listed in the "Gmsh options" chapter of the Gmsh reference manual.

Input:  name (string), value (string)
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples:  C++ (t8.cpp), Python (t8.py, test.py)

gmsh/option/getColor
Get the r, g, b, a value of a color option. name is of the form "Category.Color.Option" or "Category[num].Color.Option". Available categories and options are listed in the "Gmsh options" chapter of the Gmsh reference manual. For conciseness "Color." can be ommitted in name.

Input:  name (string)
Output:  value (string)
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples:  Python (test.py)

gmsh/option/setColor
Set a color option to the RGBA value (r, g, b, a), where where r, g, b and a should be integers between 0 and 255. name is of the form "Category.Color.Option" or "Category[num].Color.Option". Available categories and options are listed in the "Gmsh options" chapter of the Gmsh reference manual. For conciseness "Color." can be ommitted in name.

Input:  name (string), r (integer), g (integer), b (integer), a = 255 (integer)
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples:  C++ (t3.cpp, t8.cpp), Python (t3.py, t8.py)
Input:    name (string)
Output:   r (integer), g (integer), b (integer), a (integer)
Return:   -
Language-specific definition:
          C++, C, Python, Julia
Examples: C++ (t3.cpp), Python (t3.py)

6.3 Namespace gmsh/model: model functions

gmsh/model/add
    Add a new model, with name name, and set it as the current model.
Input:    name (string)
Output:   -
Return:   -
Language-specific definition:
          C++, C, Python, Julia
Examples: C++ (t1.cpp, t2.cpp, t3.cpp, t4.cpp, t6.cpp, ...), Python (t1.py, t2.py,
           t3.py, t4.py, t5.py, ...)

gmsh/model/remove
    Remove the current model.
Input:    -
Output:   -
Return:   -
Language-specific definition:
          C++, C, Python, Julia

gmsh/model/list
    List the names of all models.
Input:    -
Output:   names (vector of strings)
Return:   -
Language-specific definition:
          C++, C, Python, Julia

gmsh/model/getCurrent
    Get the name of the current model.
Input:    -
Output:   name (string)
Return:   -
Language-specific definition:
          C++, C, Python, Julia
Examples: C++ (x1.cpp), Python (x1.py, explore.py)
**gmsh/model/setCurrent**
Set the current model to the model with name `name`. If several models have the same name, select the one that was added first.

Input: `name` (string)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia
Examples: Python (copy mesh.py)

**gmsh/model/getFileName**
Get the file name (if any) associated with the current model. A file name is associated when a model is read from a file on disk.

Input: -
Output: `fileName` (string)
Return: -
Language-specific definition:
C++, C, Python, Julia

**gmsh/model/setFileName**
Set the file name associated with the current model.

Input: `fileName` (string)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

**gmsh/model/getEntities**
Get all the entities in the current model. A model entity is represented by two integers: its dimension (dim == 0, 1, 2 or 3) and its tag (its unique, strictly positive identifier). If dim is >= 0, return only the entities of the specified dimension (e.g. points if dim == 0). The entities are returned as a vector of (dim, tag) pairs.

Input: `dim = -1` (integer)
Output: `dimTags` (vector of pairs of integers)
Return: -
Language-specific definition:
C++, C, Python, Julia

**gmsh/model/setEntityName**
Set the name of the entity of dimension `dim` and tag `tag`.

Input: `dim` (integer), `tag` (integer), `name` (string)
Output: -
Return: -
gmsh/model/getEntityName

Get the name of the entity of dimension \texttt{dim} and tag \texttt{tag}.

\begin{itemize}
  \item \textbf{Input:} \texttt{dim} (integer), \texttt{tag} (integer)
  \item \textbf{Output:} \texttt{name} (string)
  \item \textbf{Return:} -
\end{itemize}

Examples: C\++ (\texttt{x1.cpp}), Python (\texttt{x1.py}, \texttt{step\_assembly.py})

gmsh/model/removeEntityName

Remove the entity name \texttt{name} from the current model.

\begin{itemize}
  \item \textbf{Input:} \texttt{name} (string)
  \item \textbf{Output:} -
  \item \textbf{Return:} -
\end{itemize}

gmsh/model/getPhysicalGroups

Get all the physical groups in the current model. If \texttt{dim} is $\geq 0$, return only the entities of the specified dimension (e.g. physical points if \texttt{dim} == 0). The entities are returned as a vector of (dim, tag) pairs.

\begin{itemize}
  \item \textbf{Input:} \texttt{dim = -1} (integer)
  \item \textbf{Output:} \texttt{dimTags} (vector of pairs of integers)
  \item \textbf{Return:} -
\end{itemize}

gmsh/model/getEntitiesForPhysicalGroup

Get the tags of the model entities making up the physical group of dimension \texttt{dim} and tag \texttt{tag}.

\begin{itemize}
  \item \textbf{Input:} \texttt{dim} (integer), \texttt{tag} (integer)
  \item \textbf{Output:} \texttt{tags} (vector of integers)
  \item \textbf{Return:} -
\end{itemize}

gmsh/model/getEntitiesForPhysicalName

Get the model entities (as a vector (dim, tag) pairs) making up the physical group with name \texttt{name}.

\begin{itemize}
  \item \textbf{Input:} \texttt{name} (string)
\end{itemize}
Chapter 6: Gmsh application programming interface

Output:  \texttt{dimTags} (vector of pairs of integers)
Return:  -
Language-specific definition:
\texttt{C++}, \texttt{C}, Python, Julia

\texttt{gmsh/model/getPhysicalGroupsForEntity}
Get the tags of the physical groups (if any) to which the model entity of dimension \texttt{dim} and tag \texttt{tag} belongs.

Input:  \texttt{dim} (integer), \texttt{tag} (integer)
Output:  \texttt{physicalTags} (vector of integers)
Return:  -
Language-specific definition:
\texttt{C++}, \texttt{C}, Python, Julia
Examples:  C++ (\texttt{x1.cpp}), Python (\texttt{x1.py})

\texttt{gmsh/model/addPhysicalGroup}
Add a physical group of dimension \texttt{dim}, grouping the model entities with tags \texttt{tags}. Return the tag of the physical group, equal to \texttt{tag} if \texttt{tag} is positive, or a new tag if \texttt{tag} < 0. Set the name of the physical group if \texttt{name} is not empty.

Input:  \texttt{dim} (integer), \texttt{tags} (vector of integers), \texttt{tag} = -1 (integer), \texttt{name} = "" (string)
Output:  -
Return:  integer
Language-specific definition:
\texttt{C++}, \texttt{C}, Python, Julia
Examples:  C++ (\texttt{t1.cpp}, \texttt{t2.cpp}, \texttt{t3.cpp}, \texttt{t5.cpp}, \texttt{t14.cpp}, ...), Python (\texttt{t1.py}, \texttt{t2.py}, \texttt{t3.py}, \texttt{t5.py}, \texttt{t14.py}, ...)

\texttt{gmsh/model/removePhysicalGroups}
Remove the physical groups \texttt{dimTags} (given as a vector of (dim, tag) pairs) from the current model. If \texttt{dimTags} is empty, remove all groups.

Input:  \texttt{dimTags} = \emptyset (vector of pairs of integers)
Output:  -
Return:  -
Language-specific definition:
\texttt{C++}, \texttt{C}, Python, Julia

\texttt{gmsh/model/setPhysicalName}
Set the name of the physical group of dimension \texttt{dim} and tag \texttt{tag}.

Input:  \texttt{dim} (integer), \texttt{tag} (integer), \texttt{name} (string)
Output:  -
Return:  -
Language-specific definition:
\texttt{C++}, \texttt{C}, Python, Julia
Examples:  Python (\texttt{poisson.py}, \texttt{step\_assembly.py})
gmsh/model/getPhysicalName
Get the name of the physical group of dimension dim and tag tag.
Input:  dim (integer), tag (integer)
Output: name (string)
Return: -
Language-specific definition:
C++, C, Python, Julia
Examples: C++ (x1.cpp), Python (x1.py, poisson.py)

gmsh/model/removePhysicalName
Remove the physical name name from the current model.
Input:  name (string)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/setTag
Set the tag of the entity of dimension dim and tag tag to the new value newTag.
Input:  dim (integer), tag (integer), newTag (integer)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/getBoundary
Get the boundary of the model entities dimTags, given as a vector of (dim, tag) pairs. Return in outDimTags the boundary of the individual entities (if combined is false) or the boundary of the combined geometrical shape formed by all input entities (if combined is true). Return tags multiplied by the sign of the boundary entity if oriented is true. Apply the boundary operator recursively down to dimension 0 (i.e. to points) if recursive is true.
Input:  dimTags (vector of pairs of integers), combined = True (boolean), oriented = True (boolean), recursive = False (boolean)
Output: outDimTags (vector of pairs of integers)
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/getAdjacencies
Get the upward and downward adjacencies of the model entity of dimension dim and tag tag. The upward vector returns the tags of adjacent entities of dimension dim + 1; the downward vector returns the tags of adjacent entities of dimension dim - 1.
Chapter 6: Gmsh application programming interface

Input: \( \text{dim} \) (integer), \( \text{tag} \) (integer)
Output: \text{upward} (vector of integers), \text{downward} (vector of integers)
Return: -
Language-specific definition:
- C++
- C
- Python
- Julia
Examples: C++ (x1.cpp), Python (x1.py)

\text{gmsh/model/getEntitiesInBoundingBox}
Get the model entities in the bounding box defined by the two points \((\text{xmin}, \text{ymin}, \text{zmin})\) and \((\text{xmax}, \text{ymax}, \text{zmax})\). If \text{dim} \geq 0, return only the entities of the specified dimension (e.g. points if \text{dim} == 0).
Input: \text{xmin} (double), \text{ymin} (double), \text{zmin} (double), \text{xmax} (double), \text{ymax} (double), \text{zmax} (double), \text{dim} = -1 (integer)
Output: \text{dimTags} (vector of pairs of integers)
Return: -
Language-specific definition:
- C++
- C
- Python
- Julia
Examples: C++ (t16.cpp, t18.cpp, t20.cpp), Python (t16.py, t18.py, t20.py, naca_boundary_layer_3d.py)

\text{gmsh/model/getBoundingBox}
Get the bounding box \((\text{xmin}, \text{ymin}, \text{zmin}), (\text{xmax}, \text{ymax}, \text{zmax})\) of the model entity of dimension \text{dim} and tag \text{tag}. If \text{dim} and \text{tag} are negative, get the bounding box of the whole model.
Input: \text{dim} (integer), \text{tag} (integer)
Output: \text{xmin} (double), \text{ymin} (double), \text{zmin} (double), \text{xmax} (double), \text{ymax} (double), \text{zmax} (double)
Return: -
Language-specific definition:
- C++
- C
- Python
- Julia
Examples: C++ (t18.cpp), Python (t18.py)

\text{gmsh/model/getDimension}
Return the geometrical dimension of the current model.
Input: -
Output: -
Return: integer
Language-specific definition:
- C++
- C
- Python
- Julia
Examples: C++ (x1.cpp), Python (x1.py)

\text{gmsh/model/addDiscreteEntity}
Add a discrete model entity (defined by a mesh) of dimension \text{dim} in the current model. Return the tag of the new discrete entity, equal to \text{tag} if \text{tag} is positive, or a new tag if \text{tag} < 0. \text{boundary} specifies the tags of the entities on the boundary of the discrete entity, if any. Specifying \text{boundary} allows Gmsh to construct the topology of the overall model.
Input: \( \text{dim} \) (integer), \( \text{tag} = -1 \) (integer), \( \text{boundary} = [] \) (vector of integers)

Output: -

Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (x2.cpp, x4.cpp, x7.cpp), Python (x2.py, x4.py, x7.py, copy_mesh.py, discrete.py, ...)

**gmsh/model/removeEntities**

Remove the entities \( \text{dimTags} \) (given as a vector of (dim, tag) pairs) of the current model, provided that they are not on the boundary of (or embedded in) higher-dimensional entities. If \( \text{recursive} \) is true, remove all the entities on their boundaries, down to dimension 0.

Input: \( \text{dimTags} \) (vector of pairs of integers), \( \text{recursive} = \text{False} \) (boolean)

Output: -

Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t18.cpp, t20.cpp), Python (t18.py, t20.py, spherical_surf.py)

**gmsh/model/getType**

Get the type of the entity of dimension \( \text{dim} \) and tag \( \text{tag} \).

Input: \( \text{dim} \) (integer), \( \text{tag} \) (integer)

Output: \( \text{entityType} \) (string)

Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t21.cpp, x1.cpp), Python (t21.py, x1.py, explore.py, partition.py)

**gmsh/model/getParent**

In a partitioned model, get the parent of the entity of dimension \( \text{dim} \) and tag \( \text{tag} \), i.e. from which the entity is a part of, if any. \( \text{parentDim} \) and \( \text{parentTag} \) are set to -1 if the entity has no parent.

Input: \( \text{dim} \) (integer), \( \text{tag} \) (integer)

Output: \( \text{parentDim} \) (integer), \( \text{parentTag} \) (integer)

Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t21.cpp, x1.cpp), Python (t21.py, x1.py, explore.py, partition.py)

**gmsh/model/getNumberOfPartitions**

Return the number of partitions in the model.

Input: -

Output: -
**gmsh/model/getPartitions**

In a partitioned model, return the tags of the partition(s) to which the entity belongs.

**Input:**
- `dim (integer)`, `tag (integer)`

**Output:**
- `partitions (vector of integers)`

**Return:**
- 

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:**
- C++ (t21.cpp, x1.cpp), Python (t21.py, x1.py, explore.py, partition.py)

---

**gmsh/model/getValue**

Evaluate the parametrization of the entity of dimension `dim` and tag `tag` at the parametric coordinates `parametricCoord`. Only valid for `dim` equal to 0 (with empty `parametricCoord`), 1 (with `parametricCoord` containing parametric coordinates on the curve) or 2 (with `parametricCoord` containing u, v parametric coordinates on the surface, concatenated: `[p1u, p1v, p2u, ...]`). Return x, y, z coordinates in `coord`, concatenated: `[p1x, p1y, p1z, p2x, ...]`.

**Input:**
- `dim (integer)`, `tag (integer)`, `parametricCoord (vector of doubles)`

**Output:**
- `coord (vector of doubles)`

**Return:**
- 

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:**
- C++ (t2.cpp, x5.cpp), Python (t2.py, x5.py, reparamOnFace.py, terrain_stl.py)

---

**gmsh/model/getDerivative**

Evaluate the derivative of the parametrization of the entity of dimension `dim` and tag `tag` at the parametric coordinates `parametricCoord`. Only valid for `dim` equal to 1 (with `parametricCoord` containing parametric coordinates on the curve) or 2 (with `parametricCoord` containing u, v parametric coordinates on the surface, concatenated: `[p1u, p1v, p2u, ...]`). For `dim` equal to 1 return the x, y, z components of the derivative with respect to u `[d1ux, d1uy, d1uz, d2ux, ...]`; for `dim` equal to 2 return the x, y, z components of the derivative with respect to u and v: `[d1ux, d1uy, d1uz, d1vx, d1vy, d1vz, d2ux, ...]`.

**Input:**
- `dim (integer)`, `tag (integer)`, `parametricCoord (vector of doubles)`

**Output:**
- `derivatives (vector of doubles)`

**Return:**
- 

**Language-specific definition:**
- C++, C, Python, Julia

---

**gmsh/model/getSecondDerivative**

Evaluate the second derivative of the parametrization of the entity of dimension `dim` and tag `tag` at the parametric coordinates `parametricCoord`. Only valid for `dim` equal to 1 (with `parametricCoord` containing parametric coordinates on the curve)
or 2 (with \texttt{parametricCoord} containing \(u, v\) parametric coordinates on the surface, concatenated: \([p1u, p1v, p2u, ...]\)). For \(\text{dim}\) equal to 1 return the \(x, y, z\) components of the second derivative with respect to \(u\) \([d1uxx, d1uyy, d1uuz, d2uxx, ...]\); for \(\text{dim}\) equal to 2 return the \(x, y, z\) components of the second derivative with respect to \(u\) and \(v\), and the mixed derivative with respect to \(u\) and \(v\): \([d1uxx, d1uyy, d1uuz, d1vxx, d1vyy, d1vzx, d1vzx, d1uvx, d1uvx, d2uxx, ...]\).

\textbf{Input:} \(\text{dim}\) (integer), \texttt{tag} (integer), \texttt{parametricCoord} (vector of doubles)

\textbf{Output:} \texttt{derivatives} (vector of doubles)

\textbf{Return:} -

\textbf{Language-specific definition:}
\begin{itemize}
  \item C++
  \item C
  \item Python
  \item Julia
\end{itemize}

\texttt{gmsh/model/getCurvature}

Evaluate the (maximum) curvature of the entity of dimension \(\text{dim}\) and \texttt{tag} at the parametric coordinates \texttt{parametricCoord}. Only valid for \(\text{dim}\) equal to 1 (with \texttt{parametricCoord} containing parametric coordinates on the curve) or 2 (with \texttt{parametricCoord} containing \(u, v\) parametric coordinates on the surface, concatenated: \([p1u, p1v, p2u, ...]\)).

\textbf{Input:} \(\text{dim}\) (integer), \texttt{tag} (integer), \texttt{parametricCoord} (vector of doubles)

\textbf{Output:} \texttt{curvatures} (vector of doubles)

\textbf{Return:} -

\textbf{Language-specific definition:}
\begin{itemize}
  \item C++
  \item C
  \item Python
  \item Julia
\end{itemize}

\textbf{Examples:} C++ (\texttt{x5.cpp}), Python (\texttt{x5.py}, \texttt{normals.py})

\texttt{gmsh/model/getPrincipalCurvatures}

Evaluate the principal curvatures of the surface with \texttt{tag} at the parametric coordinates \texttt{parametricCoord}, as well as their respective directions. \texttt{parametricCoord} are given by pair of \(u\) and \(v\) coordinates, concatenated: \([p1u, p1v, p2u, ...]\).

\textbf{Input:} \texttt{tag} (integer), \texttt{parametricCoord} (vector of doubles)

\textbf{Output:} \texttt{curvatureMax} (vector of doubles), \texttt{curvatureMin} (vector of doubles), \texttt{directionMax} (vector of doubles), \texttt{directionMin} (vector of doubles)

\textbf{Return:} -

\textbf{Language-specific definition:}
\begin{itemize}
  \item C++
  \item C
  \item Python
  \item Julia
\end{itemize}

\texttt{gmsh/model/getNormal}

Get the normal to the surface with \texttt{tag} at the parametric coordinates \texttt{parametricCoord}. The \texttt{parametricCoord} vector should contain \(u\) and \(v\) coordinates, concatenated: \([p1u, p1v, p2u, ...]\). \texttt{normals} are returned as a vector of \(x, y, z\) components, concatenated: \([n1x, n1y, n1z, n2x, ...]\).

\textbf{Input:} \texttt{tag} (integer), \texttt{parametricCoord} (vector of doubles)

\textbf{Output:} \texttt{normals} (vector of doubles)

\textbf{Return:} -

\textbf{Language-specific definition:}
\begin{itemize}
  \item C++
  \item C
  \item Python
  \item Julia
\end{itemize}
Examples: C++ (x5.cpp), Python (x5.py, normals.py)

**gmsh/model/getParametrization**

Get the parametric coordinates `parametricCoord` for the points `coord` on the entity of dimension `dim` and tag `tag`. `coord` are given as x, y, z coordinates, concatenated: `[p1x, p1y, p1z, p2x, ...]`. `parametricCoord` returns the parametric coordinates `t` on the curve (if `dim` = 1) or `u` and `v` coordinates concatenated on the surface (if `dim` = 2), i.e. `[p1t, p2t, ...]` or `[p1u, p1v, p2u, ...].

Input: `dim` (integer), `tag` (integer), `coord` (vector of doubles)

Output: `parametricCoord` (vector of doubles)

Return: -

Language-specific definition:

C++, C, Python, Julia

**gmsh/model/getParametrizationBounds**

Get the `min` and `max` bounds of the parametric coordinates for the entity of dimension `dim` and tag `tag`.

Input: `dim` (integer), `tag` (integer)

Output: `min` (vector of doubles), `max` (vector of doubles)

Return: -

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (x5.cpp), Python (x5.py, reparamOnFace.py)

**gmsh/model/isInside**

Check if the coordinates (or the parametric coordinates if `parametric` is set) provided in `coord` correspond to points inside the entity of dimension `dim` and tag `tag`, and return the number of points inside. This feature is only available for a subset of entities, depending on the underlying geometrical representation.

Input: `dim` (integer), `tag` (integer), `coord` (vector of doubles), `parametric` = False (boolean)

Output: -

Return: integer

Language-specific definition:

C++, C, Python, Julia

**gmsh/model/getClosestPoint**

Get the points `closestCoord` on the entity of dimension `dim` and tag `tag` to the points `coord`, by orthogonal projection. `coord` and `closestCoord` are given as x, y, z coordinates, concatenated: `[p1x, p1y, p1z, p2x, ...]`. `parametricCoord` returns the parametric coordinates `t` on the curve (if `dim` = 1) or `u` and `v` coordinates concatenated on the surface (if `dim` = 2), i.e. `[p1t, p2t, ...]` or `[p1u, p1v, p2u, ...].

Input: `dim` (integer), `tag` (integer), `coord` (vector of doubles)

Output: `closestCoord` (vector of doubles), `parametricCoord` (vector of doubles)

Return: -
Language-specific definition:

- C++, C, Python, Julia

Examples: Python (closest_point.py)

**gmsh/model/reparametrizeOnSurface**

Reparametrize the boundary entity (point or curve, i.e. with \( \text{dim} == 0 \) or \( \text{dim} == 1 \)) of tag \( \text{tag} \) on the surface \( \text{surfaceTag} \). If \( \text{dim} == 1 \), reparametrize all the points corresponding to the parametric coordinates \( \text{parametricCoord} \). Multiple matches in case of periodic surfaces can be selected with \( \text{which} \). This feature is only available for a subset of entities, depending on the underlying geometrical representation.

Input:

- \( \text{dim} \) (integer), \( \text{tag} \) (integer), \( \text{parametricCoord} \) (vector of doubles),
- \( \text{surfaceTag} \) (integer), \( \text{which} = 0 \) (integer)

Output:

- \( \text{surfaceParametricCoord} \) (vector of doubles)

Return:

- 

Language-specific definition:

- C++, C, Python, Julia

Examples: C++ (x5.cpp), Python (x5.py, reparamOnFace.py)

**gmsh/model/setVisibility**

Set the visibility of the model entities \( \text{dimTags} \) (given as a vector of (dim, tag) pairs) to \( \text{value} \). Apply the visibility setting recursively if \( \text{recursive} \) is true.

Input:

- \( \text{dimTags} \) (vector of pairs of integers), \( \text{value} \) (integer), \( \text{recursive} = \text{False} \) (boolean)

Output:

- 

Return:

- 

Language-specific definition:

- C++, C, Python, Julia

Examples: Python (gui.py, hybrid_order.py)

**gmsh/model/getVisibility**

Get the visibility of the model entity of dimension \( \text{dim} \) and tag \( \text{tag} \).

Input:

- \( \text{dim} \) (integer), \( \text{tag} \) (integer)

Output:

- \( \text{value} \) (integer)

Return:

- 

Language-specific definition:

- C++, C, Python, Julia

**gmsh/model/setVisibilityPerWindow**

Set the global visibility of the model per window to \( \text{value} \), where \( \text{windowIndex} \) identifies the window in the window list.

Input:

- \( \text{value} \) (integer), \( \text{windowIndex} = 0 \) (integer)

Output:

- 

Return:

- 

Language-specific definition:

- C++, C, Python, Julia
gmsh/model/setColor
Set the color of the model entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) to the RGBA value \((r, g, b, a)\), where \(r, g, b\) and \(a\) should be integers between 0 and 255. Apply the color setting recursively if \texttt{recursive} is true.

Input: \(\texttt{dimTags}\) (vector of pairs of integers), \(r\) (integer), \(g\) (integer), \(b\) (integer), \(a = 255\) (integer), \texttt{recursive = False} (boolean)

Output: -

Return: -

Language-specific definition:
\(\text{C++}, \text{C}, \text{Python, Julia}\)

Examples: \(\text{C++ (t4.cpp)}, \text{Python (t4.py, gui.py)}\)

gmsh/model/getColor
Get the color of the model entity of dimension \texttt{dim} and tag \texttt{tag}. If no color is specified for the entity, return fully transparent blue, i.e. \((0, 0, 255, 0)\).

Input: \(\texttt{dim}\) (integer), \(\texttt{tag}\) (integer)

Output: \(r\) (integer), \(g\) (integer), \(b\) (integer), \(a\) (integer)

Return: -

Language-specific definition:
\(\text{C++}, \text{C}, \text{Python, Julia}\)

Examples: \(\text{Python (step_boundary_colors.py)}\)

gmsh/model/setCoordinates
Set the \(x, y, z\) coordinates of a geometrical point.

Input: \(\texttt{tag}\) (integer), \(x\) (double), \(y\) (double), \(z\) (double)

Output: -

Return: -

Language-specific definition:
\(\text{C++}, \text{C}, \text{Python, Julia}\)

Examples: \(\text{C++ (x2.cpp)}, \text{Python (x2.py, reparamOnFace.py)}\)

gmsh/model/setAttribute
Set the values of the attribute with name \texttt{name}.

Input: \(\texttt{name}\) (string), \(\texttt{values}\) (vector of strings)

Output: -

Return: -

Language-specific definition:
\(\text{C++}, \text{C}, \text{Python, Julia}\)

Examples: \(\text{Python (msh_attributes.py)}\)

gmsh/model/getAttribute
Get the values of the attribute with name \texttt{name}.

Input: \(\texttt{name}\) (string)

Output: \(\texttt{values}\) (vector of strings)
Return: -
Language-specific definition:
  C++, C, Python, Julia
Examples:  Python (msh_attributes.py)

 gmsh/model/getAttributeNames
Get the names of any optional attributes stored in the model.
Input: -
Output: names (vector of strings)
Return: -
Language-specific definition:
  C++, C, Python, Julia
Examples:  Python (msh_attributes.py)

 gmsh/model/removeAttribute
Remove the attribute with name name.
Input: name (string)
Output: -
Return: -
Language-specific definition:
  C++, C, Python, Julia

6.4 Namespace gmsh/model/mesh: mesh functions

 gmsh/model/mesh/generate
Generate a mesh of the current model, up to dimension dim (0, 1, 2 or 3).
Input: dim = 3 (integer)
Output: -
Return: -
Language-specific definition:
  C++, C, Python, Julia
Examples:  C++ (t1.cpp, t2.cpp, t3.cpp, t4.cpp, t5.cpp, ...), Python (t1.py, t2.py, t3.py, t4.py, t5.py, ...)

 gmsh/model/mesh/partition
Partition the mesh of the current model into numPart partitions. Optionally, elementTags and partitions can be provided to specify the partition of each element explicitly.
Input: numPart (integer), elementTags = [] (vector of sizes), partitions = [] (vector of integers)
Output: -
Return: -
Language-specific definition:
  C++, C, Python, Julia
Examples:  C++ (t21.cpp), Python (t21.py, partition.py)
gmsh/model/mesh/unpartition

Unpartition the mesh of the current model.

Input: -
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh/model/mesh/optimize

Optimize the mesh of the current model using method (empty for default tetrahedral mesh optimizer, "Netgen" for Netgen optimizer, "HighOrder" for direct high-order mesh optimizer, "HighOrderElastic" for high-order elastic smoother, "HighOrderFastCurving" for fast curving algorithm, "Laplace2D" for Laplace smoothing, "Relocate2D" and "Relocate3D" for node relocation, "QuadQuasiStructured" for quad mesh optimization, "UntangleMeshGeometry" for untangling). If force is set apply the optimization also to discrete entities. If dimTags (given as a vector of (dim, tag) pairs) is given, only apply the optimizer to the given entities.

Input: method = "" (string), force = False (boolean), niter = 1 (integer), dimTags = [] (vector of pairs of integers)

Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (naca_boundary_layer_2d.py, naca_boundary_layer_3d.py, opt.py, tube_boundary_layer.py)

gmsh/model/mesh/recombine

Recombine the mesh of the current model.

Input: -
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (stl_to_mesh.py)

gmsh/model/mesh/refine

Refine the mesh of the current model by uniformly splitting the elements.

Input: -
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh/model/mesh/setOrder

Set the order of the elements in the mesh of the current model to order.

Input: order (integer)
Output:  -
Return:  -

Language-specific definition:
  C++, C, Python, Julia

Examples:  C++  (x6.cpp),  Python  (x6.py,  hybrid_order.py,  naca_boundary_layer_2d.py,  naca_boundary_layer_3d.py,  tube_boundary_layer.py)

\texttt{gmsh/model/mesh/getLastEntityError}  
Get the last entities \texttt{dimTags} (as a vector of (dim, tag) pairs) where a meshing error occurred. Currently only populated by the new 3D meshing algorithms.

Input:  -
Output:  \texttt{dimTags}  (vector of pairs of integers)
Return:  -

Language-specific definition:
  C++, C, Python, Julia

\texttt{gmsh/model/mesh/getLastNodeError}  
Get the last node tags \texttt{nodeTags} where a meshing error occurred. Currently only populated by the new 3D meshing algorithms.

Input:  -
Output:  \texttt{nodeTags}  (vector of sizes)
Return:  -

Language-specific definition:
  C++, C, Python, Julia

\texttt{gmsh/model/mesh/clear}  
Clear the mesh, i.e. delete all the nodes and elements, for the entities \texttt{dimTags}, given as a vector of (dim, tag) pairs. If \texttt{dimTags} is empty, clear the whole mesh. Note that the mesh of an entity can only be cleared if this entity is not on the boundary of another entity with a non-empty mesh.

Input:  \texttt{dimTags} = \emptyset  (vector of pairs of integers)
Output:  -
Return:  -

Language-specific definition:
  C++, C, Python, Julia

Examples:  Python  (copy_mesh.py, flatten.py)

\texttt{gmsh/model/mesh/reverse}  
Reverse the orientation of the elements in the entities \texttt{dimTags}, given as a vector of (dim, tag) pairs. If \texttt{dimTags} is empty, reverse the orientation of the elements in the whole mesh.

Input:  \texttt{dimTags} = \emptyset  (vector of pairs of integers)
Output:  -
Return:  -
Language-specific definition:

C++, C, Python, Julia

Examples: Python (mirror_mesh.py)

**gmsh/model/mesh/affineTransform**

Apply the affine transformation `affineTransform` (16 entries of a 4x4 matrix, by row; only the 12 first can be provided for convenience) to the coordinates of the nodes classified on the entities `dimTags`, given as a vector of (dim, tag) pairs. If `dimTags` is empty, transform all the nodes in the mesh.

**Input:**
- `affineTransform` (vector of doubles), `dimTags = []` (vector of pairs of integers)

**Output:**
- 

**Return:**
- 

Language-specific definition:

C++, C, Python, Julia

Examples: Python (flatten2.py)

**gmsh/model/mesh/getNodes**

Get the nodes classified on the entity of dimension `dim` and tag `tag`. If `tag < 0`, get the nodes for all entities of dimension `dim`. If `dim` and `tag` are negative, get all the nodes in the mesh. `nodeTags` contains the node tags (their unique, strictly positive identification numbers). `coord` is a vector of length 3 times the length of `nodeTags` that contains the x, y, z coordinates of the nodes, concatenated: `[n1x, n1y, n1z, n2x, ...]`. If `dim >= 0` and `returnParametricCoord` is set, `parametricCoord` contains the parametric coordinates ([u1, u2, ...] or [u1, v1, u2, ...]) of the nodes, if available. The length of `parametricCoord` can be 0 or `dim` times the length of `nodeTags`. If `includeBoundary` is set, also return the nodes classified on the boundary of the entity (which will be reparametrized on the entity if `dim >= 0` in order to compute their parametric coordinates).

**Input:**
- `dim = -1` (integer), `tag = -1` (integer), `includeBoundary = False` (boolean), `returnParametricCoord = True` (boolean)

**Output:**
- `nodeTags` (vector of sizes), `coord` (vector of doubles), `parametricCoord` (vector of doubles)

**Return:**
- 

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (x1.cpp, x4.cpp, x5.cpp), Python (x1.py, x4.py, x5.py, adapt_mesh.py, copy_mesh.py, ...)

**gmsh/model/mesh/getNodesByElementType**

Get the nodes classified on the entity of tag `tag`, for all the elements of type `elementType`. The other arguments are treated as in `getNodes`.

**Input:**
- `elementType` (integer), `tag = -1` (integer), `returnParametricCoord = True` (boolean)

**Output:**
- `nodeTags` (vector of sizes), `coord` (vector of doubles), `parametricCoord` (vector of doubles)

**Return:**
- -
Language-specific definition:
   C++, C, Python, Julia

Examples: Python (stl_to_brep.py)

**gmsh/model/mesh/getNode**

Get the coordinates and the parametric coordinates (if any) of the node with tag `tag`, as well as the dimension `dim` and tag `tag` of the entity on which the node is classified. This function relies on an internal cache (a vector in case of dense node numbering, a map otherwise); for large meshes accessing nodes in bulk is often preferable.

Input: `nodeTag` (size)

Output: `coord` (vector of doubles), `parametricCoord` (vector of doubles), `dim` (integer), `tag` (integer)

Return: -

Language-specific definition:
   C++, C, Python, Julia

**gmsh/model/mesh/setNode**

Set the coordinates and the parametric coordinates (if any) of the node with tag `tag`.

This function relies on an internal cache (a vector in case of dense node numbering, a map otherwise); for large meshes accessing nodes in bulk is often preferable.

Input: `nodeTag` (size), `coord` (vector of doubles), `parametricCoord` (vector of doubles)

Output: -

Return: -

Language-specific definition:
   C++, C, Python, Julia

**gmsh/model/mesh/rebuildNodeCache**

Rebuild the node cache.

Input: `onlyIfNecessary = True` (boolean)

Output: -

Return: -

Language-specific definition:
   C++, C, Python, Julia

**gmsh/model/mesh/rebuildElementCache**

Rebuild the element cache.

Input: `onlyIfNecessary = True` (boolean)

Output: -

Return: -

Language-specific definition:
   C++, C, Python, Julia

**gmsh/model/mesh/getNodesForPhysicalGroup**

Get the nodes from all the elements belonging to the physical group of dimension `dim` and tag `tag`. `nodeTags` contains the node tags; `coord` is a vector of length 3 times the length of `nodeTags` that contains the x, y, z coordinates of the nodes, concatenated: `[n1x, n1y, n1z, n2x, ...].`
Input: \( \text{dim} \) (integer), \( \text{tag} \) (integer)
Output: \( \text{nodeTags} \) (vector of sizes), \( \text{coord} \) (vector of doubles)
Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh\_model\_mesh\_getMaxNodeTag
Get the maximum tag \( \text{maxTag} \) of a node in the mesh.
Input: -
Output: \( \text{maxTag} \) (size)
Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh\_model\_mesh\_addNodes
Add nodes classified on the model entity of dimension \( \text{dim} \) and tag \( \text{tag} \). \( \text{nodeTags} \) contains the node tags (their unique, strictly positive identification numbers). \( \text{coord} \) is a vector of length 3 times the length of \( \text{nodeTags} \) that contains the \( x \), \( y \), \( z \) coordinates of the nodes, concatenated: \([n1x, n1y, n1z, n2x, ...]\). The optional \( \text{parametricCoord} \) vector contains the parametric coordinates of the nodes, if any. The length of \( \text{parametricCoord} \) can be 0 or \( \text{dim} \) times the length of \( \text{nodeTags} \). If the \( \text{nodeTags} \) vector is empty, new tags are automatically assigned to the nodes.
Input: \( \text{dim} \) (integer), \( \text{tag} \) (integer), \( \text{nodeTags} \) (vector of sizes), \( \text{coord} \) (vector of doubles), \( \text{parametricCoord} = [] \) (vector of doubles)
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x2.cpp, x4.cpp), Python (x2.py, x4.py, copy\_mesh.py, discrete.py, flatten.py, ...)

gmsh\_model\_mesh\_reclassifyNodes
Reclassify all nodes on their associated model entity, based on the elements. Can be used when importing nodes in bulk (e.g. by associating them all to a single volume), to reclassify them correctly on model surfaces, curves, etc. after the elements have been set.
Input: -
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x2.cpp), Python (x2.py, terrain.py)

gmsh\_model\_mesh\_relocateNodes
Relocate the nodes classified on the entity of dimension \( \text{dim} \) and tag \( \text{tag} \) using their parametric coordinates. If \( \text{tag} < 0 \), relocate the nodes for all entities of dimension \( \text{dim} \). If \( \text{dim} \) and \( \text{tag} \) are negative, relocate all the nodes in the mesh.
Input: \( \text{dim} = -1 \) (integer), \( \text{tag} = -1 \) (integer)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (relocate_nodes.py)

\texttt{gmsh/model/mesh/getElements}

Get the elements classified on the entity of dimension \( \text{dim} \) and tag \( \text{tag} \). If \( \text{tag} < 0 \), get the elements for all entities of dimension \( \text{dim} \). If \( \text{dim} \) and \( \text{tag} \) are negative, get all the elements in the mesh. \texttt{elementTypes} contains the MSH types of the elements (e.g. 2 for 3-node triangles: see \texttt{getElementProperties} to obtain the properties for a given element type). \texttt{elementTags} is a vector of the same length as \texttt{elementTypes}; each entry is a vector containing the tags (unique, strictly positive identifiers) of the elements of the corresponding type. \texttt{nodeTags} is also a vector of the same length as \texttt{elementTypes}; each entry is a vector of length equal to the number of elements of the given type times the number \( N \) of nodes for this type of element, that contains the node tags of all the elements of the given type, concatenated: \([e1n1, e1n2, ..., e1nN, e2n1, ...].\)

Input: \( \text{dim} = -1 \) (integer), \( \text{tag} = -1 \) (integer)

Output: \texttt{elementTypes} (vector of integers), \texttt{elementTags} (vector of vectors of sizes), \texttt{nodeTags} (vector of vectors of sizes)

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x1.cpp), Python (x1.py, copy_mesh.py, explore.py, flatten.py, mesh_quality.py, ...)

\texttt{gmsh/model/mesh/getElement}

Get the type and node tags of the element with tag \( \text{tag} \), as well as the dimension \( \text{dim} \) and tag \( \text{tag} \) of the entity on which the element is classified. This function relies on an internal cache (a vector in case of dense element numbering, a map otherwise); for large meshes accessing elements in bulk is often preferable.

Input: \texttt{elementTag} (size)

Output: \texttt{elementType} (integer), \texttt{nodeTags} (vector of sizes), \texttt{dim} (integer), \texttt{tag} (integer)

Return: -

Language-specific definition:
C++, C, Python, Julia

\texttt{gmsh/model/mesh/getElementByCoordinates}

Search the mesh for an element located at coordinates \((x, y, z)\). This function performs a search in a spatial octree. If an element is found, return its tag, type and node tags, as well as the local coordinates \((u, v, w)\) within the reference element corresponding to search location. If \( \text{dim} \) is \( >= 0 \), only search for elements of the given dimension. If \texttt{strict} is not set, use a tolerance to find elements near the search location.
Input:  \(x\) (double), \(y\) (double), \(z\) (double), \(\text{dim} = -1\) (integer), \(\text{strict} = \text{False}\) (boolean)

Output: \(\text{elementTag}\) (size), \(\text{elementType}\) (integer), \(\text{nodeTags}\) (vector of sizes),  
\(u\) (double), \(v\) (double), \(w\) (double)

Return: -

Language-specific definition:
\(\text{C++}, \text{C}, \text{Python}, \text{Julia}\)

\text{gmsh/model/mesh/getElementsByCoordinates}

Search the mesh for element(s) located at coordinates \((x, y, z)\). This function performs a search in a spatial octree. Return the tags of all found elements in \(\text{elementTags}\). Additional information about the elements can be accessed through \text{getElement} and \text{getLocalCoordinatesInElement}. If \(\text{dim} \geq 0\), only search for elements of the given dimension. If \(\text{strict}\) is not set, use a tolerance to find elements near the search location.

Input:  \(x\) (double), \(y\) (double), \(z\) (double), \(\text{dim} = -1\) (integer), \(\text{strict} = \text{False}\) (boolean)

Output: \(\text{elementTags}\) (vector of sizes)

Return: -

Language-specific definition:
\(\text{C++}, \text{C}, \text{Python}, \text{Julia}\)

\text{gmsh/model/mesh/getLocalCoordinatesInElement}

Return the local coordinates \((u, v, w)\) within the element \(\text{elementTag}\) corresponding to the model coordinates \((x, y, z)\). This function relies on an internal cache (a vector in case of dense element numbering, a map otherwise); for large meshes accessing elements in bulk is often preferable.

Input:  \(\text{elementTag}\) (size), \(x\) (double), \(y\) (double), \(z\) (double)

Output: \(u\) (double), \(v\) (double), \(w\) (double)

Return: -

Language-specific definition:
\(\text{C++}, \text{C}, \text{Python}, \text{Julia}\)

\text{gmsh/model/mesh/getElementTypes}

Get the types of elements in the entity of dimension \(\text{dim}\) and tag \(\text{tag}\). If \(\text{tag} < 0\), get the types for all entities of dimension \(\text{dim}\). If \(\text{dim}\) and \(\text{tag}\) are negative, get all the types in the mesh.

Input:  \(\text{dim} = -1\) (integer), \(\text{tag} = -1\) (integer)

Output: \(\text{elementTypes}\) (vector of integers)

Return: -

Language-specific definition:
\(\text{C++}, \text{C}, \text{Python}, \text{Julia}\)

Examples: \text{C++ (x6.cpp)}, \text{Python (x6.py, poisson.py)}

\text{gmsh/model/mesh/getElementType}

Return an element type given its family name \(\text{familyName}\) ("Point", "Line", "Triangle", "Quadangle", "Quadrangle", "Tetrahedron", "Pyramid", "Prism", "Hexahedron") and polynomial order \(\text{order}\). If \(\text{serendip}\) is true, return the corresponding serendip element type (element without interior nodes).
Input:   familyName (string), order (integer), serendip = False (boolean)
Output:  -
Return:  integer
Language-specific definition:
   C++, C, Python, Julia
Examples: C++ (x7.cpp), Python (x7.py)

**gmsh/model/mesh/getElementProperties**
Get the properties of an element of type elementType: its name (elementName), dimension (dim), order (order), number of nodes (numNodes), local coordinates of the nodes in the reference element (localNodeCoord vector, of length dim times numNodes) and number of primary (first order) nodes (numPrimaryNodes).

Input:   elementType (integer)
Output:  elementName (string), dim (integer), order (integer), numNodes (integer), localNodeCoord (vector of doubles), numPrimaryNodes (integer)
Return:  -
Language-specific definition:
   C++, C, Python, Julia
Examples: C++ (x1.cpp), Python (x1.py, x6.py, explore.py, poisson.py)

**gmsh/model/mesh/getElementsByType**
Get the elements of type elementType classified on the entity of tag tag. If tag < 0, get the elements for all entities. elementTags is a vector containing the tags (unique, strictly positive identifiers) of the elements of the corresponding type. nodeTags is a vector of length equal to the number of elements of the given type times the number N of nodes for this type of element, that contains the node tags of all the elements of the given type, concatenated: [e1n1, e1n2, ..., e1nN, e2n1, ...]. If numTasks > 1, only compute and return the part of the data indexed by task (for C++ only; output vectors must be preallocated).

Input:   elementType (integer), tag = -1 (integer), task = 0 (size), numTasks = 1 (size)
Output:  elementTags (vector of sizes), nodeTags (vector of sizes)
Return:  -
Language-specific definition:
   C++, C, Python, Julia
Examples: C++ (x1.cpp), Python (x1.py, adapt_mesh.py, neighbors.py, poisson.py, stl_to_brep.py)

**gmsh/model/mesh/getMaxElementTag**
Get the maximum tag maxTag of an element in the mesh.

Input:  -
Output: maxTag (size)
Return: -
Language-specific definition:
   C++, C, Python, Julia
Examples: C++ (x7.cpp), Python (x7.py)

**gmsh/model/mesh/preallocateElementsByType**

Preallocate data before calling `getElementsByType` with `numTasks > 1`. For C++ only.

- **Input:** `elementType` (integer), `elementTag` (boolean), `nodeTag` (boolean), `tag` = -1 (integer)
- **Output:** `elementTags` (vector of sizes), `nodeTags` (vector of sizes)
- **Return:** -

Language-specific definition:

- C++, C

**gmsh/model/mesh/getElementQualities**

Get the quality `elementQualities` of the elements with tags `elementTags`. `qualityType` is the requested quality measure: "minDetJac" and "maxDetJac" for the adaptively computed minimal and maximal Jacobian determinant, "minSJ" for the sampled minimal scaled jacobien, "minSICN" for the sampled minimal signed inverted condition number, "minSIGE" for the sampled signed inverted gradient error, "gamma" for the ratio of the inscribed to circumscribed sphere radius, "innerRadius" for the inner radius, "outerRadius" for the outerRadius, "minIsotropy" for the minimum isotropy measure, "angleShape" for the angle shape measure, "minEdge" for the minimum straight edge length, "maxEdge" for the maximum straight edge length, "volume" for the volume. If `numTasks > 1`, only compute and return the part of the data indexed by `task` (for C++ only; output vector must be preallocated).

- **Input:** `elementTags` (vector of sizes), `qualityName` = "minSICN" (string), `task` = 0 (size), `numTasks` = 1 (size)
- **Output:** `elementQuality` (vector of doubles)
- **Return:** -

Language-specific definition:

- C++, C, Python, Julia

Examples: Python (mesh_quality.py, min_edge.py, view_element_size.py)

**gmsh/model/mesh/addElements**

Add elements classified on the entity of dimension `dim` and tag `tag`. `types` contains the MSH types of the elements (e.g. 2 for 3-node triangles: see the Gmsh reference manual). `elementTags` is a vector of the same length as `types`: each entry is a vector containing the tags (unique, strictly positive identifiers) of the elements of the corresponding type. `nodeTags` is also a vector of the same length as `types`: each entry is a vector of length equal to the number of elements of the given type times the number N of nodes per element, that contains the node tags of all the elements of the given type, concatenated: [e1n1, e1n2, ..., e1N, e2n1, ...].

- **Input:** `dim` (integer), `tag` (integer), `elementTypes` (vector of integers), `elementTags` (vector of vectors of integers (size)), `nodeTags` (vector of vectors of integers (size))
- **Output:** -
- **Return:** -

Language-specific definition:

- C++, C, Python, Julia
gmsh/model/mesh/addElementsByType
Add elements of type `elementType` classified on the entity of tag `tag`. `elementTags` contains the tags (unique, strictly positive identifiers) of the elements of the corresponding type. `nodeTags` is a vector of length equal to the number of elements times the number N of nodes per element, that contains the node tags of all the elements, concatenated: [e1n1, e1n2, ..., e1nN, e2n1, ...]. If the `elementTag` vector is empty, new tags are automatically assigned to the elements.

Input: `tag` (integer), `elementType` (integer), `elementTags` (vector of sizes), `nodeTags` (vector of sizes)

Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x2.cpp, x4.cpp, x7.cpp), Python (x2.py, x4.py, x7.py, import_perf.py, raw_tetrahedralization.py, ...)

gmsh/model/mesh/getIntegrationPoints
Get the numerical quadrature information for the given element type `elementType` and integration rule `integrationType`, where `integrationType` concatenates the integration rule family name with the desired order (e.g. "Gauss4" for a quadrature suited for integrating 4th order polynomials). The "CompositeGauss" family uses tensor-product rules based the 1D Gauss-Legendre rule; the "Gauss" family uses an economic scheme when available (i.e. with a minimal number of points), and falls back to "CompositeGauss" otherwise. Note that integration points for the "Gauss" family can fall outside of the reference element for high-order rules. `localCoord` contains the u, v, w coordinates of the G integration points in the reference element: [g1u, g1v, g1w, ..., gGu, gGv, gGw]. `weights` contains the associated weights: [g1q, ..., gGq].

Input: `elementType` (integer), `integrationType` (string)

Output: `localCoord` (vector of doubles), `weights` (vector of doubles)

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (x6.py, adapt_mesh.py, poisson.py)

gmsh/model/mesh/getJacobians
Get the Jacobians of all the elements of type `elementType` classified on the entity of tag `tag`, at the G evaluation points `localCoord` given as concatenated u, v, w coordinates in the reference element [g1u, g1v, g1w, ..., gGu, gGv, gGw]. Data is returned by element, with elements in the same order as in `getElements` and `getElementsByType`. `jacobians` contains for each element the 9 entries of the 3x3 Jacobian matrix at each evaluation point. The matrix is returned by column: [e1g1Jxu, e1g1Jyu, e1g1Jzu, e1g1Jxv, ..., e1g1Jzw, e1g2Jxu, ..., e1gGJzw, e2g1Jxu, ...], with Jxu = dx/du, Jyu = dy/du, etc. `determinants` contains for each element the determinant of the Jacobian matrix at each evaluation point: [e1g1, e1g2, ..., e1gG, e2g1, ...]. `coord` contains for each element the x, y, z coordinates of the
evaluation points. If \( \text{tag} < 0 \), get the Jacobian data for all entities. If \( \text{numTasks} > 1 \), only compute and return the part of the data indexed by \( \text{task} \) (for C++ only; output vectors must be preallocated).

Input: \( \text{elementType} \) (integer), \( \text{localCoord} \) (vector of doubles), \( \text{tag} = -1 \) (integer), \( \text{task} = 0 \) (size), \( \text{numTasks} = 1 \) (size)

Output: \text{jacobians} (vector of doubles), \text{determinants} (vector of doubles), \text{coord} (vector of doubles)

Return: -

Language-specific definition: C++, C, Python, Julia

Examples: Python (x6.py, adapt_mesh.py, poisson.py)

gmsh/model/mesh/preallocateJacobians

Preallocate data before calling \text{getJacobians} with \( \text{numTasks} > 1 \). For C++ only.

Input: \( \text{elementType} \) (integer), \( \text{numEvaluationPoints} \) (integer), \( \text{allocateJacobians} \) (boolean), \( \text{allocateDeterminants} \) (boolean), \( \text{allocateCoord} \) (boolean), \( \text{tag} = -1 \) (integer)

Output: \text{jacobians} (vector of doubles), \text{determinants} (vector of doubles), \text{coord} (vector of doubles)

Return: -

Language-specific definition: C++, C

gmsh/model/mesh/getJacobian

Get the Jacobian for a single element \text{elementTag}, at the G evaluation points \text{localCoord} given as concatenated u, v, w coordinates in the reference element \([g_{1u}, g_{1v}, g_{1w}, ..., g_{Gu}, g_{Gv}, g_{Gw}]\). \text{jacobians} contains the 9 entries of the 3x3 Jacobian matrix at each evaluation point. The matrix is returned by column: \([e_{1g1Jxu}, e_{1g1Jyu}, e_{1g1Jzu}, e_{1g1Jxv}, ..., e_{1g1Jzw}, e_{1g2Jxu}, ..., e_{1gGJzw}, e_{2g1Jxu}, ...]\), with \( J_{xu} = dx/du, J_{yu} = dy/du, etc. \text{determinants} contains the determinant of the Jacobian matrix at each evaluation point. \text{coord} contains the x, y, z coordinates of the evaluation points. This function relies on an internal cache (a vector in case of dense element numbering, a map otherwise); for large meshes accessing Jacobians in bulk is often preferable.

Input: \text{elementTag} (size), \text{localCoord} (vector of doubles)

Output: \text{jacobians} (vector of doubles), \text{determinants} (vector of doubles), \text{coord} (vector of doubles)

Return: -

Language-specific definition: C++, C, Python, Julia

gmsh/model/mesh/getBasisFunctions

Get the basis functions of the element of type \text{elementType} at the evaluation points \text{localCoord} given as concatenated u, v, w coordinates in the reference element \([g_{1u}, g_{1v}, g_{1w}, ..., g_{Gu}, g_{Gv}, g_{Gw}]\), for the function space \text{functionSpaceType}. Currently supported function spaces include "Lagrange" and "GradLagrange" for isoparametric Lagrange basis functions and their gradient in the u, v, w coordinates of the reference element; "LagrangeN" and "GradLagrangeN", with \( N = 1, 2, ..., \)
for N-th order Lagrange basis functions; "H1LegendreN" and "GradH1LegendreN", with N = 1, 2, ..., for N-th order hierarchical H1 Legendre functions; "HcurlLegendreN" and "CurlHcurlLegendreN", with N = 1, 2, ..., for N-th order curl-conforming basis functions. `numComponents` returns the number C of components of a basis function (e.g. 1 for scalar functions and 3 for vector functions). `basisFunctions` returns the value of the N basis functions at the evaluation points, i.e. g1f1, g1f2, ..., g1fN, g2f1, ... when C == 1 or g1f1u, g1f1v, g1f1w, g1f2u, ..., g1fNw, g2f1u, ... when C == 3. For basis functions that depend on the orientation of the elements, all values for the first orientation are returned first, followed by values for the second, etc. `numOrientations` returns the overall number of orientations. If the `wanted Orientations` vector is not empty, only return the values for the desired orientation indices.

Input: `elementType` (integer), `localCoord` (vector of doubles), `functionSpaceType` (string), `wantedOrientations = []` (vector of integers)

Output: `numComponents` (integer), `basisFunctions` (vector of doubles), `numOrientations` (integer)

Return: -

Language-specific definition: C++, C, Python, Julia

Examples: Python (x6.py, adapt_mesh.py, poisson.py)

`gmsh/model/mesh/getBasisFunctionsOrientation`
Get the orientation index of the elements of type `elementType` in the entity of tag `tag`. The arguments have the same meaning as in `getBasisFunctions`. `basisFunctionsOrientation` is a vector giving for each element the orientation index in the values returned by `getBasisFunctions`. For Lagrange basis functions the call is superfluous as it will return a vector of zeros. If `numTasks > 1`, only compute and return the part of the data indexed by `task` (for C++ only; output vector must be preallocated).

Input: `elementType` (integer), `functionSpaceType` (string), `tag = -1` (integer), `task = 0` (size), `numTasks = 1` (size)

Output: `basisFunctionsOrientation` (integer)

Return: -

Language-specific definition: C++, C, Python, Julia

`gmsh/model/mesh/getBasisFunctionsOrientationForElement`
Get the orientation of a single element `elementTag`.

Input: `elementTag` (size), `functionSpaceType` (string)

Output: `basisFunctionsOrientation` (integer)

Return: -

Language-specific definition: C++, C, Python, Julia

`gmsh/model/mesh/getNumberOfOrientations`
Get the number of possible orientations for elements of type `elementType` and function space named `functionSpaceType`. 
gmsh/model/mesh/preallocateBasisFunctionsOrientation
Preallocate data before calling getBasisFunctionsOrientation with numTasks > 1. For C++ only.
Input: elementType (integer), tag = -1 (integer)
Output: basisFunctionsOrientation (vector of integers)
Return: -
Language-specific definition:
C++, C

gmsh/model/mesh/getEdges
Get the global unique mesh edge identifiers edgeTags and orientations edgeOrientation for an input list of node tag pairs defining these edges, concatenated in the vector nodeTags. Mesh edges are created e.g. by createEdges(), getKeys() or addEdges(). The reference positive orientation is n1 < n2, where n1 and n2 are the tags of the two edge nodes, which corresponds to the local orientation of edge-based basis functions as well.
Input: nodeTags (vector of sizes)
Output: edgeTags (vector of sizes), edgeOrientations (vector of integers)
Return: -
Language-specific definition:
C++, C, Python, Julia
Examples: C++ (x7.cpp), Python (x7.py)

gmsh/model/mesh/getFaces
Get the global unique mesh face identifiers faceTags and orientations faceOrientations for an input list of a multiple of three (if faceType == 3) or four (if faceType == 4) node tags defining these faces, concatenated in the vector nodeTags. Mesh faces are created e.g. by createFaces(), getKeys() or addFaces().
Input: faceType (integer), nodeTags (vector of sizes)
Output: faceTags (vector of sizes), faceOrientations (vector of integers)
Return: -
Language-specific definition:
C++, C, Python, Julia
Examples: C++ (x7.cpp), Python (x7.py)

gmsh/model/mesh/createEdges
Create unique mesh edges for the entities dimTags, given as a vector of (dim, tag) pairs.
Input: dimTags = [] (vector of pairs of integers)
Output:  
Return:  
Language-specific definition: 
C++, C, Python, Julia
Examples: C++ (x7.cpp), Python (x7.py)

**gmsh/model/mesh/createFaces**
Create unique mesh faces for the entities `dimTags`, given as a vector of (dim, tag) pairs.
Input:  
Output:  
Return:  
Language-specific definition: 
C++, C, Python, Julia
Examples: C++ (x7.cpp), Python (x7.py)

**gmsh/model/mesh/getAllEdges**
Get the global unique identifiers `edgeTags` and the nodes `edgeNodes` of the edges in the mesh. Mesh edges are created e.g. by `createEdges()`, `getKeys()` or `addEdges()`.
Input:  
Output:  
Return:  
Language-specific definition: 
C++, C, Python, Julia
Examples: C++ (x7.cpp), Python (x7.py)

**gmsh/model/mesh/getAllFaces**
Get the global unique identifiers `faceTags` and the nodes `faceNodes` of the faces of type `faceType` in the mesh. Mesh faces are created e.g. by `createFaces()`, `getKeys()` or `addFaces()`.
Input:  
Output:  
Return:  
Language-specific definition: 
C++, C, Python, Julia
Examples: C++ (x7.cpp), Python (x7.py)

**gmsh/model/mesh/addEdges**
Add mesh edges defined by their global unique identifiers `edgeTags` and their nodes `edgeNodes`.
Input:  
Output:  
Return:  
Language-specific definition:
C++, C, Python, Julia

**gmsh/model/mesh/addFaces**
Add mesh faces of type `faceType` defined by their global unique identifiers `faceTags` and their nodes `faceNodes`.

Input: `faceType` (integer), `faceTags` (vector of sizes), `faceNodes` (vector of sizes)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

**gmsh/model/mesh/getKeys**
Generate the pair of keys for the elements of type `elementType` in the entity of tag `tag`, for the `functionSpaceType` function space. Each pair (typeKey, entityTypeKey) uniquely identifies a basis function in the function space. If `returnCoord` is set, the `coord` vector contains the x, y, z coordinates locating basis functions for sorting purposes. Warning: this is an experimental feature and will probably change in a future release.

Input: `elementType` (integer), `functionSpaceType` (string), `tag = -1` (integer), `returnCoord = True` (boolean)

Output: `typeKeys` (vector of integers), `entityKeys` (vector of sizes), `coord` (vector of doubles)

Return: -

Language-specific definition:
C++, C, Python, Julia

**gmsh/model/mesh/getKeysForElement**
Get the pair of keys for a single element `elementTag`.

Input: `elementTag` (size), `functionSpaceType` (string), `returnCoord = True` (boolean)

Output: `typeKeys` (vector of integers), `entityKeys` (vector of sizes), `coord` (vector of doubles)

Return: -

Language-specific definition:
C++, C, Python, Julia

**gmsh/model/mesh/getNumberOfKeys**
Get the number of keys by elements of type `elementType` for function space named `functionSpaceType`.

Input: `elementType` (integer), `functionSpaceType` (string)

Output: -

Return: integer

Language-specific definition:
C++, C, Python, Julia
gmsh/model/mesh/getKeysInformation
Get information about the pair of keys. infoKeys returns information about the functions associated with the pairs (typeKeys, entityKey). infoKeys[0].first describes the type of function (0 for vertex function, 1 for edge function, 2 for face function and 3 for bubble function). infoKeys[0].second gives the order of the function associated with the key. Warning: this is an experimental feature and will probably change in a future release.

Input:  typeKeys (vector of integers), entityKeys (vector of sizes),
        elementType (integer), functionSpaceType (string)
Output: infoKeys (vector of pairs of integers)
Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh/model/mesh/getBarycenters
Get the barycenters of all elements of type elementType classified on the entity of tag tag. If primary is set, only the primary nodes of the elements are taken into account for the barycenter calculation. If fast is set, the function returns the sum of the primary node coordinates (without normalizing by the number of nodes). If tag < 0, get the barycenters for all entities. If numTasks > 1, only compute and return the part of the data indexed by task (for C++ only; output vector must be preallocated).

Input:  elementType (integer), tag (integer), fast (boolean), primary (boolean), task = 0 (size), numTasks = 1 (size)
Output: barycenters (vector of doubles)
Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh/model/mesh/preallocateBarycenters
Preallocate data before calling getBarycenters with numTasks > 1. For C++ only.

Input:  elementType (integer), tag = -1 (integer)
Output: barycenters (vector of doubles)
Return: -

Language-specific definition:
C++, C

gmsh/model/mesh/getElementEdgeNodes
Get the nodes on the edges of all elements of type elementType classified on the entity of tag tag. nodeTags contains the node tags of the edges for all the elements: [el1n1, el1n2, el2a1, ...]. Data is returned by element, with elements in the same order as in getElements and getElementsByType. If primary is set, only the primary (begin/end) nodes of the edges are returned. If tag < 0, get the edge nodes for all entities. If numTasks > 1, only compute and return the part of the data indexed by task (for C++ only; output vector must be preallocated).

Input:  elementType (integer), tag = -1 (integer), primary = False (boolean),
        task = 0 (size), numTasks = 1 (size)
Output: nodeTags (vector of sizes)
Chapter 6: Gmsh application programming interface

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x7.cpp), Python (x7.py, stl_to_brep.py)

`gmsh/model/mesh/getElementFaceNodes`
Get the nodes on the faces of type `faceType` (3 for triangular faces, 4 for quadrangular faces) of all elements of type `elementType` classified on the entity of tag `tag`. `nodeTags` contains the node tags of the faces for all elements: [e1f1n1, ..., e1f1nFaceType, e1f2n1, ...]. Data is returned by element, with elements in the same order as in `getElements` and `getElementsByType`. If `primary` is set, only the primary (corner) nodes of the faces are returned. If `tag < 0`, get the face nodes for all entities. If `numTasks > 1`, only compute and return the part of the data indexed by `task` (for C++ only; output vector must be preallocated).

Input: `elementType` (integer), `faceType` (integer), `tag = -1` (integer), `primary = False` (boolean), `task = 0` (size), `numTasks = 1` (size)

Output: `nodeTags` (vector of sizes)

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x7.cpp), Python (x7.py, neighbors.py)

`gmsh/model/mesh/getGhostElements`
Get the ghost elements `elementTags` and their associated `partitions` stored in the ghost entity of dimension `dim` and tag `tag`.

Input: `dim` (integer), `tag` (integer)

Output: `elementTags` (vector of sizes), `partitions` (vector of integers)

Return: -

Language-specific definition:
C++, C, Python, Julia

`gmsh/model/mesh/setSize`
Set a mesh size constraint on the model entities `dimTags`, given as a vector of (dim, tag) pairs. Currently only entities of dimension 0 (points) are handled.

Input: `dimTags` (vector of pairs of integers), `size` (double)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t16.cpp, t18.cpp, t21.cpp), Python (t16.py, t18.py, t21.py, adapt_mesh.py, extend_field.py, ...)

`gmsh/model/mesh/getSizes`
Get the mesh size constraints (if any) associated with the model entities `dimTags`, given as a vector of (dim, tag) pairs. A zero entry in the output `sizes` vector indicates that no size constraint is specified on the corresponding entity.

Input: `dimTags` (vector of pairs of integers)
Output:  \texttt{sizes} (vector of doubles)
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/mesh/setSizeAtParametricPoints}
Set mesh size constraints at the given parametric points \texttt{parametricCoord} on the model entity of dimension \texttt{dim} and tag \texttt{tag}. Currently only entities of dimension 1 (lines) are handled.
Input:  \texttt{dim} (integer), \texttt{tag} (integer), \texttt{parametricCoord} (vector of doubles), \texttt{sizes} (vector of doubles)
Output: -
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/mesh/setSizeCallback}
Set a mesh size callback for the current model. The callback function should take six arguments as input (\texttt{dim}, \texttt{tag}, \texttt{x}, \texttt{y}, \texttt{z} and \texttt{lc}). The first two integer arguments correspond to the dimension \texttt{dim} and tag \texttt{tag} of the entity being meshed. The next four double precision arguments correspond to the coordinates \texttt{x}, \texttt{y} and \texttt{z} around which to prescribe the mesh size and to the mesh size \texttt{lc} that would be prescribed if the callback had not been called. The callback function should return a double precision number specifying the desired mesh size; returning \texttt{lc} is equivalent to a no-op.
Input:  \texttt{callback} ()
Output: -
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}
Examples: \texttt{C++} (t10.cpp), \texttt{Python} (t10.py)

\texttt{gmsh/model/mesh/removeSizeCallback}
Remove the mesh size callback from the current model.
Input:  -
Output: -
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/mesh/setTransfiniteCurve}
Set a transfinite meshing constraint on the curve \texttt{tag}, with \texttt{numNodes} nodes distributed according to \texttt{meshType} and \texttt{coef}. Currently supported types are "Progression" (geometrical progression with power \texttt{coef}), "Bump" (refinement toward both extremities of the curve) and "Beta" (beta law).
Input:  \texttt{tag} (integer), \texttt{numNodes} (integer), \texttt{meshType} = "Progression" (string), \texttt{coef} = 1. (double)
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x2.cpp), Python (x2.py, terrain.py, terrain_bspline.py, terrain_stl.py)

**gmsh/model/mesh/setTransfiniteSurface**

Set a transfinite meshing constraint on the surface tag. **arrangement** describes the arrangement of the triangles when the surface is not flagged as recombined: currently supported values are "Left", "Right", "AlternateLeft" and "AlternateRight". **cornerTags** can be used to specify the (3 or 4) corners of the transfinite interpolation explicitly; specifying the corners explicitly is mandatory if the surface has more than 3 or 4 points on its boundary.

Input:  
tag (integer), **arrangement** = "Left" (string), **cornerTags** = [] (vector of integers)

Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x2.cpp), Python (x2.py, get_data_perf.py, terrain.py, terrain_bspline.py, terrain_stl.py)

**gmsh/model/mesh/setTransfiniteVolume**

Set a transfinite meshing constraint on the surface tag. **cornerTags** can be used to specify the (6 or 8) corners of the transfinite interpolation explicitly.

Input:  
tag (integer), **cornerTags** = [] (vector of integers)

Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x2.cpp), Python (x2.py, terrain.py, terrain_bspline.py, terrain_stl.py)

**gmsh/model/mesh/setTransfiniteAutomatic**

Set transfinite meshing constraints on the model entities in **dimTags**, given as a vector of (dim, tag) pairs. Transfinite meshing constraints are added to the curves of the quadrangular surfaces and to the faces of 6-sided volumes. Quadrangular faces with a corner angle superior to **cornerAngle** (in radians) are ignored. The number of points is automatically determined from the sizing constraints. If **dimTag** is empty, the constraints are applied to all entities in the model. If **recombine** is true, the recombine flag is automatically set on the transfinite surfaces.

Input:  
**dimTags** = [] (vector of pairs of integers), **cornerAngle** = 2.35 (double), **recombine** = True (boolean)

Output: -
Return: -
Language-specific definition:

C++, C, Python, Julia

Examples: C++ (x2.cpp, x6.cpp), Python (x2.py, x6.py)

gmsh/model/mesh/setRecombine

Set a recombination meshing constraint on the model entity of dimension $\text{dim}$ and tag $\text{tag}$. Currently only entities of dimension 2 (to recombine triangles into quadrangles) are supported; $\text{angle}$ specifies the threshold angle for the simple recombination algorithm.

Input:

$\text{dim}$ (integer), $\text{tag}$ (integer), $\text{angle} = 45.$ (double)

Output: -

Return: -

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (t11.cpp, x2.cpp), Python (t11.py, x2.py, poisson.py, terrain.py, terrain bspline.py, ...)

gmsh/model/mesh/setSmoothing

Set a smoothing meshing constraint on the model entity of dimension $\text{dim}$ and tag $\text{tag}$. $\text{val}$ iterations of a Laplace smoother are applied.

Input:

$\text{dim}$ (integer), $\text{tag}$ (integer), $\text{val}$ (integer)

Output: -

Return: -

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (x2.cpp), Python (x2.py, terrain.py, terrain bspline.py, terrain stl.py)

gmsh/model/mesh/setReverse

Set a reverse meshing constraint on the model entity of dimension $\text{dim}$ and tag $\text{tag}$. If $\text{val}$ is true, the mesh orientation will be reversed with respect to the natural mesh orientation (i.e. the orientation consistent with the orientation of the geometry). If $\text{val}$ is false, the mesh is left as-is.

Input:

$\text{dim}$ (integer), $\text{tag}$ (integer), $\text{val} = \text{True}$ (boolean)

Output: -

Return: -

Language-specific definition:

C++, C, Python, Julia

gmsh/model/mesh/setAlgorithm

Set the meshing algorithm on the model entity of dimension $\text{dim}$ and tag $\text{tag}$. Supported values are those of the Mesh.Algorithm option, as listed in the Gmsh reference manual. Currently only supported for $\text{dim} == 2$.

Input:

$\text{dim}$ (integer), $\text{tag}$ (integer), $\text{val}$ (integer)

Output: -

Return: -
Language-specific definition:
  \texttt{C\++, C, Python, Julia}

Examples: \texttt{C\++ (t5.cpp), Python (t5.py)}

\texttt{gmsh/model/mesh/setSizeFromBoundary}
Force the mesh size to be extended from the boundary, or not, for the model entity of dimension \texttt{dim} and tag \texttt{tag}. Currently only supported for \texttt{dim == 2}.

Input:
\texttt{dim (integer), tag (integer), val (integer)}

Output: -
Return: -

Language-specific definition:
  \texttt{C\++, C, Python, Julia}

\texttt{gmsh/model/mesh/setCompound}
Set a compound meshing constraint on the model entities of dimension \texttt{dim} and tags \texttt{tags}. During meshing, compound entities are treated as a single discrete entity, which is automatically reparametrized.

Input:
\texttt{dim (integer), tags (vector of integers)}

Output: -
Return: -

Language-specific definition:
  \texttt{C\++, C, Python, Julia}

Examples: \texttt{C\++ (t12.cpp), Python (t12.py)}

\texttt{gmsh/model/mesh/setOutwardOrientation}
Set meshing constraints on the bounding surfaces of the volume of tag \texttt{tag} so that all surfaces are oriented with outward pointing normals; and if a mesh already exists, reorient it. Currently only available with the OpenCASCADE kernel, as it relies on the STL triangulation.

Input:
\texttt{tag (integer)}

Output: -
Return: -

Language-specific definition:
  \texttt{C\++, C, Python, Julia}

\texttt{gmsh/model/mesh/removeConstraints}
Remove all meshing constraints from the model entities \texttt{dimTags}, given as a vector of (dim, tag) pairs. If \texttt{dimTags} is empty, remove all constraints.

Input:
\texttt{dimTags = [] (vector of pairs of integers)}

Output: -
Return: -

Language-specific definition:
  \texttt{C\++, C, Python, Julia}

Examples: Python (terrain_bspline.py)
gmsh/model/mesh/embed
Embed the model entities of dimension \( \text{dim} \) and tags \( \text{tags} \) in the \((\text{inDim}, \text{inTag})\) model entity. The dimension \( \text{dim} \) can 0, 1 or 2 and must be strictly smaller than \( \text{inDim} \), which must be either 2 or 3. The embedded entities should not intersect each other or be part of the boundary of the entity \( \text{inTag} \), whose mesh will conform to the mesh of the embedded entities. With the OpenCASCADE kernel, if the \text{fragment} operation is applied to entities of different dimensions, the lower dimensional entities will be automatically embedded in the higher dimensional entities if they are not on their boundary.

Input: \( \text{dim} \) (integer), \( \text{tags} \) (vector of integers), \( \text{inDim} \) (integer), \( \text{inTag} \) (integer)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia
Examples: C++ (t15.cpp), Python (t15.py)

gmsh/model/mesh/removeEmbedded
Remove embedded entities from the model entities \( \text{dimTags} \), given as a vector of \((\text{dim}, \text{tag})\) pairs. If \( \text{dim} \) is \(\geq 0\), only remove embedded entities of the given dimension (e.g. embedded points if \( \text{dim} == 0 \)).

Input: \( \text{dimTags} \) (vector of pairs of integers), \( \text{dim} = -1 \) (integer)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/mesh/getEmbedded
Get the entities (if any) embedded in the model entity of dimension \( \text{dim} \) and tag \( \text{tag} \).

Input: \( \text{dim} \) (integer), \( \text{tag} \) (integer)
Output: \( \text{dimTags} \) (vector of pairs of integers)
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/mesh/reorderElements
Reorder the elements of type \( \text{elementType} \) classified on the entity of tag \( \text{tag} \) according to the \( \text{ordering} \) vector.

Input: \( \text{elementType} \) (integer), \( \text{tag} \) (integer), \( \text{ordering} \) (vector of sizes)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/mesh/computeRenumbering
Compute a renumbering vector \( \text{newTags} \) corresponding to the input tags \( \text{oldTags} \) for a given list of element tags \( \text{elementTags} \). If \( \text{elementTags} \) is empty, compute
the renumbering on the full mesh. If method is equal to "RCMK", compute a node renumbering with Reverse Cuthill McKee. If method is equal to "Hilbert", compute a node renumbering along a Hilbert curve. If method is equal to "Metis", compute a node renumbering using Metis. Element renumbering is not available yet.

Input:  method = "RCMK" (string), elementTags = [] (vector of sizes)
Output: oldTags (vector of sizes), newTags (vector of sizes)
Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (renumbering.py)

`gmsh/model/mesh/renumberNodes`
Renumber the node tags. If no explicit renumbering is provided through the oldTags and newTags vectors, renumber the nodes in a continuous sequence, taking into account the subset of elements to be saved later on if the option "Mesh.SaveAll" is not set.

Input: oldTags = [] (vector of sizes), newTags = [] (vector of sizes)
Output: -
Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (renumbering.py, view_renumbering.py)

`gmsh/model/mesh/renumberElements`
Renumber the element tags in a continuous sequence. If no explicit renumbering is provided through the oldTags and newTags vectors, renumber the elements in a continuous sequence, taking into account the subset of elements to be saved later on if the option "Mesh.SaveAll" is not set.

Input: oldTags = [] (vector of sizes), newTags = [] (vector of sizes)
Output: -
Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (view_renumbering.py)

`gmsh/model/mesh/setPeriodic`
Set the meshes of the entities of dimension dim and tag tags as periodic copies of the meshes of entities tagsMaster, using the affine transformation specified in affineTransformation (16 entries of a 4x4 matrix, by row). If used after meshing, generate the periodic node correspondence information assuming the meshes of entities tags effectively match the meshes of entities tagsMaster (useful for structured and extruded meshes). Currently only available for dim == 1 and dim == 2.

Input: dim (integer), tags (vector of integers), tagsMaster (vector of integers), affineTransform (vector of doubles)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t18.cpp), Python (t18.py, periodic.py)

gmsh/model/mesh/getPeriodic
Get master entities \texttt{tagsMaster} for the entities of dimension \texttt{dim} and tags \texttt{tags}.

Input: \texttt{dim} (integer), \texttt{tags} (vector of integers)
Output: \texttt{tagMaster} (vector of integers)
Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh/model/mesh/getPeriodicNodes
Get the master entity \texttt{tagMaster}, the node tags \texttt{nodeTags} and their corresponding master node tags \texttt{nodeTagsMaster}, and the affine transform \texttt{affineTransform} for the entity of dimension \texttt{dim} and tag \texttt{tag}. If \texttt{includeHighOrderNodes} is set, include high-order nodes in the returned data.

Input: \texttt{dim} (integer), \texttt{tag} (integer), \texttt{includeHighOrderNodes} = False (boolean)
Output: \texttt{tagMaster} (integer), \texttt{nodeTags} (vector of sizes), \texttt{nodeTagsMaster} (vector of sizes), \texttt{affineTransform} (vector of doubles)
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (periodic.py)

gmsh/model/mesh/getPeriodicKeys
Get the master entity \texttt{tagMaster} and the key pairs (\texttt{typeKeyMaster}, \texttt{entityKeyMaster}) corresponding to the entity \texttt{tag} and the key pairs (\texttt{typeKey}, \texttt{entityKey}) for the elements of type \texttt{elementType} and function space type \texttt{functionSpaceType}. If \texttt{returnCoord} is set, the \texttt{coord} and \texttt{coordMaster} vectors contain the x, y, z coordinates locating basis functions for sorting purposes.

Input: \texttt{elementType} (integer), \texttt{functionSpaceType} (string), \texttt{tag} (integer), \texttt{returnCoord} = True (boolean)
Output: \texttt{tagMaster} (integer), \texttt{typeKeys} (vector of integers), \texttt{typeKeysMaster} (vector of integers), \texttt{entityKeys} (vector of sizes), \texttt{entityKeysMaster} (vector of sizes), \texttt{coord} (vector of doubles), \texttt{coordMaster} (vector of doubles)
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (periodic.py)

gmsh/model/mesh/importStl
Import the model STL representation (if available) as the current mesh.

Input: -
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (stl_to_mesh.py)

\texttt{gmsh/model/mesh/getDuplicateNodes}

Get the \texttt{tags} of any duplicate nodes in the mesh of the entities \texttt{dimTags}, given as a vector of (dim, tag) pairs. If \texttt{dimTags} is empty, consider the whole mesh.

Input: \texttt{dimTags = []} (vector of pairs of integers)

Output: \texttt{tags} (vector of sizes)

Return: -

Language-specific definition:
C++, C, Python, Julia

\texttt{gmsh/model/mesh/removeDuplicateNodes}

Remove duplicate nodes in the mesh of the entities \texttt{dimTags}, given as a vector of (dim, tag) pairs. If \texttt{dimTags} is empty, consider the whole mesh.

Input: \texttt{dimTags = []} (vector of pairs of integers)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (glue_and_remesh_stl.py, mirror_mesh.py, stl_to_mesh.py, view_adaptive_to_mesh.py)

\texttt{gmsh/model/mesh/removeDuplicateElements}

Remove duplicate elements (defined by the same nodes, in the same entity) in the mesh of the entities \texttt{dimTags}, given as a vector of (dim, tag) pairs. If \texttt{dimTags} is empty, consider the whole mesh.

Input: \texttt{dimTags = []} (vector of pairs of integers)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

\texttt{gmsh/model/mesh/splitQuadrangles}

Split (into two triangles) all quadrangles in surface \texttt{tag} whose quality is lower than \texttt{quality}. If \texttt{tag < 0}, split quadrangles in all surfaces.

Input: \texttt{quality = 1.} (double), \texttt{tag = -1} (integer)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

\texttt{gmsh/model/mesh/setVisibility}

Set the visibility of the elements of tags \texttt{elementTags} to \texttt{value}. 
Input: \( \text{elementTags} \) (vector of sizes), \( \text{value} \) (integer)

Output: -

Return: -

Language-specific definition:
\( \text{C++}, \text{C}, \text{Python}, \text{Julia} \)

**gmsh/model/mesh/getVisibility**

Get the visibility of the elements of tags \( \text{elementTags} \).

Input: \( \text{elementTags} \) (vector of sizes)

Output: \( \text{values} \) (vector of integers)

Return: -

Language-specific definition:
\( \text{C++}, \text{C}, \text{Python}, \text{Julia} \)

**gmsh/model/mesh/classifySurfaces**

Classify ("color") the surface mesh based on the angle threshold \( \text{angle} \) (in radians), and create new discrete surfaces, curves and points accordingly. If \( \text{boundary} \) is set, also create discrete curves on the boundary if the surface is open. If \( \text{forReparametrization} \) is set, create curves and surfaces that can be reparametrized using a single map. If \( \text{curveAngle} \) is less than \( \pi \), also force curves to be split according to \( \text{curveAngle} \). If \( \text{exportDiscrete} \) is set, clear any built-in CAD kernel entities and export the discrete entities in the built-in CAD kernel.

Input: \( \text{angle} \) (double), \( \text{boundary} = \text{True} \) (boolean), \( \text{forReparametrization} = \text{False} \) (boolean), \( \text{curveAngle} = \pi \) (double), \( \text{exportDiscrete} = \text{True} \) (boolean)

Output: -

Return: -

Language-specific definition:
\( \text{C++}, \text{C}, \text{Python}, \text{Julia} \)

Examples: C++ (t13.cpp), Python (t13.py, aneurysm.py, glue_and_remesh_stl.py, remesh_stl.py, terrain_stl.py)

**gmsh/model/mesh/createGeometry**

Create a geometry for the discrete entities \( \text{dimTags} \) (given as a vector of (dim, tag) pairs) represented solely by a mesh (without an underlying CAD description), i.e. create a parametrization for discrete curves and surfaces, assuming that each can be parametrized with a single map. If \( \text{dimTags} \) is empty, create a geometry for all the discrete entities.

Input: \( \text{dimTags} = \emptyset \) (vector of pairs of integers)

Output: -

Return: -

Language-specific definition:
\( \text{C++}, \text{C}, \text{Python}, \text{Julia} \)

Examples: C++ (t13.cpp, x2.cpp), Python (t13.py, x2.py, aneurysm.py, glue_and_remesh_stl.py, remesh_stl.py, ...)
gmsh/model/mesh/createTopology
Create a boundary representation from the mesh if the model does not have one (e.g. when imported from mesh file formats with no BRep representation of the underlying model). If `makeSimplyConnected` is set, enforce simply connected discrete surfaces and volumes. If `exportDiscrete` is set, clear any built-in CAD kernel entities and export the discrete entities in the built-in CAD kernel.

Input: `makeSimplyConnected = True` (boolean), `exportDiscrete = True` (boolean)

Output: -

Return: -

Language-specific definition: C++, C, Python, Julia

gmsh/model/mesh/addHomologyRequest
Add a request to compute a basis representation for homology spaces (if `type == "Homology"`) or cohomology spaces (if `type == "Cohomology"`). The computation domain is given in a list of physical group tags `domainTags`; if empty, the whole mesh is the domain. The computation subdomain for relative (co)homology computation is given in a list of physical group tags `subdomainTags`; if empty, absolute (co)homology is computed. The dimensions of the (co)homology bases to be computed are given in the list `dim`; if empty, all bases are computed. Resulting basis representation (co)chains are stored as physical groups in the mesh. If the request is added before mesh generation, the computation will be performed at the end of the meshing pipeline.

Input: `type = "Homology"` (string), `domainTags = []` (vector of integers), `subdomainTags = []` (vector of integers), `dims = []` (vector of integers)

Output: -

Return: -

Language-specific definition: C++, C, Python, Julia

Examples: C++ (t14.cpp), Python (t14.py)

gmsh/model/mesh/clearHomologyRequests
Clear all (co)homology computation requests.

Input: -

Output: -

Return: -

Language-specific definition: C++, C, Python, Julia

gmsh/model/mesh/computeHomology
Perform the (co)homology computations requested by `addHomologyRequest()`. The newly created physical groups are returned in `dimTags` as a vector of (dim, tag) pairs.

Input: -

Output: `dimTags` (vector of pairs of integers)

Return: -
Language-specific definition:

C++, C, Python, Julia

gmsh/model/mesh/computeCrossField

Compute a cross field for the current mesh. The function creates 3 views: the H function, the Theta function and cross directions. Return the tags of the views.

Input: -
Output: viewTags (vector of integers)
Return: -

Language-specific definition:

C++, C, Python, Julia

gmsh/model/mesh/triangulate

Triangulate the points given in the coord vector as pairs of u, v coordinates, and return the node tags (with numbering starting at 1) of the resulting triangles in tri.

Input: coord (vector of doubles)
Output: tri (vector of sizes)
Return: -

Language-specific definition:

C++, C, Python, Julia

Examples: Python (raw_triangulation.py)

gmsh/model/mesh/tetrahedralize

Tetrahedralize the points given in the coord vector as x, y, z coordinates, concatenated, and return the node tags (with numbering starting at 1) of the resulting tetrahedra in tetra.

Input: coord (vector of doubles)
Output: tetra (vector of sizes)
Return: -

Language-specific definition:

C++, C, Python, Julia

Examples: Python (raw_tetrahedralization.py)

6.5 Namespace gmsh/model/mesh/field: mesh size field functions

gmsh/model/mesh/field/add

Add a new mesh size field of type fieldType. If tag is positive, assign the tag explicitly; otherwise a new tag is assigned automatically. Return the field tag. Available field types are listed in the "Gmsh mesh size fields" chapter of the Gmsh reference manual.

Input: fieldType (string), tag = -1 (integer)
Output: -
Return: integer

Language-specific definition:

C++, C, Python, Julia
Examples: C++ (t7.cpp, t10.cpp, t11.cpp, t13.cpp, t17.cpp), Python (t7.py, t10.py, t13.py, t17.py, adapt_mesh.py, ...)

**gmsh/model/mesh/field/remove**
Remove the field with tag `tag`.

Input: `tag` (integer)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

**gmsh/model/mesh/field/list**
Get the list of all fields.

Input: -

Output: `tags` (vector of integers)

Return: -

Language-specific definition:
C++, C, Python, Julia

**gmsh/model/mesh/field/getType**
Get the type `fileType` of the field with tag `tag`.

Input: `tag` (integer)

Output: `fileType` (string)

Return: -

Language-specific definition:
C++, C, Python, Julia

**gmsh/model/mesh/field/setNumber**
Set the numerical option `option` to value `value` for field `tag`.

Input: `tag` (integer), `option` (string), `value` (double)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t7.cpp, t10.cpp, t17.cpp), Python (t7.py, t10.py, t17.py, adapt_mesh.py, copy_mesh.py, ...)

**gmsh/model/mesh/field/number**
Get the value of the numerical option `option` for field `tag`.

Input: `tag` (integer), `option` (string)

Output: `value` (double)

Return: -

Language-specific definition:
C++, C, Python, Julia

**gmsh/model/mesh/field/setString**
Set the string option `option` to value `value` for field `tag`. 
Input:  \texttt{tag} (integer), \texttt{option} (string), \texttt{value} (string)
Output: -
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}
Examples: \texttt{C++ (t10.cpp, t11.cpp, t13.cpp)}, \texttt{Python (t10.py, t13.py)}

\texttt{gmsh/model/mesh/field/getString}
Get the value of the string option \texttt{option} for field \texttt{tag}.
Input:  \texttt{tag} (integer), \texttt{option} (string)
Output: \texttt{value} (string)
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/mesh/field/setNumbers}
Set the numerical list option \texttt{option} to \texttt{values} for field \texttt{tag}.
Input:  \texttt{tag} (integer), \texttt{option} (string), \texttt{values} (vector of doubles)
Output: -
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}
Examples: \texttt{C++ (t10.cpp)}, \texttt{Python (t10.py, extend_field.py, naca_boundary_layer_2d.py, ocean.py)}

\texttt{gmsh/model/mesh/field/getNumbers}
Get the value of the numerical list option \texttt{option} for field \texttt{tag}.
Input:  \texttt{tag} (integer), \texttt{option} (string)
Output: \texttt{values} (vector of doubles)
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/mesh/field/setAsBackgroundMesh}
Set the field \texttt{tag} as the background mesh size field.
Input:  \texttt{tag} (integer)
Output: -
Return: -
Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}
Examples: \texttt{C++ (t7.cpp, t10.cpp, t11.cpp, t13.cpp, t17.cpp)}, \texttt{Python (t7.py, t10.py, t13.py, t17.py, adapt_mesh.py, ...)}

\texttt{gmsh/model/mesh/field/setAsBoundaryLayer}
Set the field \texttt{tag} as a boundary layer size field.
Input: tag (integer)
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (naca_boundary_layer_2d.py)

6.6 Namespace gmsh/model/geo: built-in CAD kernel functions

\texttt{gmsh/model/geo/addPoint}
Add a geometrical point in the built-in CAD representation, at coordinates (x, y, z). If \texttt{meshSize} is > 0, add a meshing constraint at that point. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the point. (Note that the point will be added in the current model only after \texttt{synchronize} is called. This behavior holds for all the entities added in the geo module.)

Input: x (double), y (double), z (double), meshSize = 0. (double), tag = -1 (integer)
Output: -
Return: integer

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t1.cpp, t2.cpp, t3.cpp, t5.cpp, t6.cpp, ...), Python (t1.py, t2.py, t3.py, t5.py, t6.py, ...)

\texttt{gmsh/model/geo/addLine}
Add a straight line segment in the built-in CAD representation, between the two points with tags \texttt{startTag} and \texttt{endTag}. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the line.

Input: startTag (integer), endTag (integer), tag = -1 (integer)
Output: -
Return: integer

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t1.cpp, t2.cpp, t3.cpp, t5.cpp, t6.cpp, ...), Python (t1.py, t2.py, t3.py, t5.py, t6.py, ...)

\texttt{gmsh/model/geo/addCircleArc}
Add a circle arc (strictly smaller than Pi) in the built-in CAD representation, between the two points with tags \texttt{startTag} and \texttt{endTag}, and with center \texttt{centerTag}. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. If (nx, ny, nz) != (0, 0, 0), explicitly set the plane of the circle arc. Return the tag of the circle arc.

Input: startTag (integer), centerTag (integer), endTag (integer), tag = -1 (integer), nx = 0. (double), ny = 0. (double), nz = 0. (double)
Output: -
Return: integer
Language-specific definition:
C++, C, Python, Julia
Examples: C++ (t5.cpp), Python (t5.py)

`gmsh/model/geo/addEllipseArc`
Add an ellipse arc (strictly smaller than Pi) in the built-in CAD representation, between the two points `startTag` and `endTag`, and with center `centerTag` and major axis point `majorTag`. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. If \((nx, ny, nz) \neq (0, 0, 0)\), explicitly set the plane of the circle arc. Return the tag of the ellipse arc.

Input: `startTag` (integer), `centerTag` (integer), `majorTag` (integer), `endTag` (integer), `tag = -1` (integer), `nx = 0.` (double), `ny = 0.` (double), `nz = 0.` (double)

Output: -
Return: integer
Language-specific definition:
C++, C, Python, Julia

`gmsh/model/geo/addSpline`
Add a spline (Catmull-Rom) curve in the built-in CAD representation, going through the points `pointTags`. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Create a periodic curve if the first and last points are the same. Return the tag of the spline curve.

Input: `pointTags` (vector of integers), `tag = -1` (integer)

Output: -
Return: integer
Language-specific definition:
C++, C, Python, Julia
Examples: C++ (t12.cpp), Python (t12.py)

`gmsh/model/geo/addBSpline`
Add a cubic b-spline curve in the built-in CAD representation, with `pointTags` control points. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Creates a periodic curve if the first and last points are the same. Return the tag of the b-spline curve.

Input: `pointTags` (vector of integers), `tag = -1` (integer)

Output: -
Return: integer
Language-specific definition:
C++, C, Python, Julia

`gmsh/model/geo/addBezier`
Add a Bezier curve in the built-in CAD representation, with `pointTags` control points. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the Bezier curve.

Input: `pointTags` (vector of integers), `tag = -1` (integer)
Chapter 6: Gmsh application programming interface

Output: -
Return: integer
Language-specific definition: C++, C, Python, Julia

gmsh/model/geo/addPolyline
Add a polyline curve in the built-in CAD representation, going through the points pointTags. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Create a periodic curve if the first and last points are the same. Return the tag of the polyline curve.

Input: pointTags (vector of integers), tag = -1 (integer)
Output: -
Return: integer
Language-specific definition: C++, C, Python, Julia

gmsh/model/geo/addCompoundSpline
Add a spline (Catmull-Rom) curve in the built-in CAD representation, going through points sampling the curves in curveTags. The density of sampling points on each curve is governed by numIntervals. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the spline.

Input: curveTags (vector of integers), numIntervals = 5 (integer), tag = -1 (integer)
Output: -
Return: integer
Language-specific definition: C++, C, Python, Julia

gmsh/model/geo/addCompoundBSpline
Add a b-spline curve in the built-in CAD representation, with control points sampling the curves in curveTags. The density of sampling points on each curve is governed by numIntervals. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the b-spline.

Input: curveTags (vector of integers), numIntervals = 20 (integer), tag = -1 (integer)
Output: -
Return: integer
Language-specific definition: C++, C, Python, Julia

gmsh/model/geo/addCurveLoop
Add a curve loop (a closed wire) in the built-in CAD representation, formed by the curves curveTags. curveTags should contain (signed) tags of model entities of dimension 1 forming a closed loop: a negative tag signifies that the underlying curve is considered with reversed orientation. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. If reorient is set, automatically reorient the curves if necessary. Return the tag of the curve loop.
Input: \texttt{curveTags} (vector of integers), \texttt{tag} = \texttt{-1} (integer), \texttt{reorient} = \texttt{False} (boolean)

Output: -

Return: integer

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++} (t1.cpp, t2.cpp, t3.cpp, t5.cpp, t6.cpp, ...), \texttt{Python} (t1.py, t2.py, t3.py, t5.py, t6.py, ...)

\texttt{gmsh/model/geo/addCurveLoops}
Add curve loops in the built-in CAD representation based on the curves \texttt{curveTags}. Return the \texttt{tags} of found curve loops, if any.

Input: \texttt{curveTags} (vector of integers)

Output: \texttt{tags} (vector of integers)

Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{Python} (aneurysm.py, tube\_boundary\_layer.py)

\texttt{gmsh/model/geo/addPlaneSurface}
Add a plane surface in the built-in CAD representation, defined by one or more curve loops \texttt{wireTags}. The first curve loop defines the exterior contour; additional curve loop define holes. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the surface.

Input: \texttt{wireTags} (vector of integers), \texttt{tag} = \texttt{-1} (integer)

Output: -

Return: integer

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++} (t1.cpp, t2.cpp, t3.cpp, t5.cpp, t6.cpp, ...), \texttt{Python} (t1.py, t2.py, t3.py, t5.py, t6.py, ...)

\texttt{gmsh/model/geo/addSurfaceFilling}
Add a surface in the built-in CAD representation, filling the curve loops in \texttt{wireTags} using transfinite interpolation. Currently only a single curve loop is supported; this curve loop should be composed by 3 or 4 curves only. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the surface.

Input: \texttt{wireTags} (vector of integers), \texttt{tag} = \texttt{-1} (integer), \texttt{sphereCenterTag} = \texttt{-1} (integer)

Output: -

Return: integer

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++} (t5.cpp, t12.cpp), \texttt{Python} (t5.py, t12.py)
**gmsh/model/geo/addSurfaceLoop**

Add a surface loop (a closed shell) formed by `surfaceTags` in the built-in CAD representation. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the shell.

**Input:** `surfaceTags` (vector of integers), `tag = -1` (integer)

**Output:** -

**Return:** integer

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:**
- C++ (`t2.cpp`, `t5.cpp`, `t13.cpp`, `x2.cpp`),
- Python (`t2.py`, `t5.py`, `t13.py`, `x2.py`, `aneurysm.py`, ...)

**gmsh/model/geo/addVolume**

Add a volume (a region) in the built-in CAD representation, defined by one or more shells `shellTags`. The first surface loop defines the exterior boundary; additional surface loop define holes. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the volume.

**Input:** `shellTags` (vector of integers), `tag = -1` (integer)

**Output:** -

**Return:** integer

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:**
- C++ (`t2.cpp`, `t5.cpp`, `t13.cpp`, `x2.cpp`),
- Python (`t2.py`, `t5.py`, `t13.py`, `x2.py`, `aneurysm.py`, ...)

**gmsh/model/geo/addGeometry**

Add a geometry in the built-in CAD representation. `geometry` can currently be one of "Sphere" or "PolarSphere" (where `numbers` should contain the x, y, z coordinates of the center, followed by the radius), or "Parametric" (where `strings` should contains three expression evaluating to the x, y and z coordinates. If `tag` is positive, set the tag of the geometry explicitly; otherwise a new tag is selected automatically. Return the tag of the geometry.

**Input:** `geometry` (string), `numbers = []` (vector of doubles), `strings = []` (vector of strings), `tag = -1` (integer)

**Output:** -

**Return:** integer

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:**
- Python (`ocean.py`)

**gmsh/model/geo/addPointOnGeometry**

Add a point in the built-in CAD representation, at coordinates (x, y, z) on the geometry `geometryTag`. If `meshSize` is > 0, add a meshing constraint at that point. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the point. For surface geometries, only the x and y coordinates are used.
Input:  

| geometryTag (integer), x (double), y (double), z = 0. (double), meshSize = 0. (double), tag = -1 (integer) |

Output: -

Return: integer

Language-specific definition:
C++, C, Python, Julia

Examples: Python (ocean.py)

**gmsh/model/geo/extrude**

Extrude the entities dimTags (given as a vector of (dim, tag) pairs) in the built-in CAD representation, using a translation along (dx, dy, dz). Return extruded entities in outDimTags. If the numElements vector is not empty, also extrude the mesh: the entries in numElements give the number of elements in each layer. If the height vector is not empty, it provides the (cumulative) height of the different layers, normalized to 1. If recombine is set, recombine the mesh in the layers.

Input:  

| dimTags (vector of pairs of integers), dx (double), dy (double), dz (double), numElements = [] (vector of integers), heights = [] (vector of doubles), recombine = False (boolean) |

Output:  

| outDimTags (vector of pairs of integers) |

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t2.cpp, t3.cpp, t14.cpp, t15.cpp), Python (t2.py, t3.py, t14.py, t15.py, hex.py)

**gmsh/model/geo/revolve**

Extrude the entities dimTags (given as a vector of (dim, tag) pairs) in the built-in CAD representation, using a rotation of angle radians around the axis of revolution defined by the point (x, y, z) and the direction (ax, ay, az). The angle should be strictly smaller than Pi. Return extruded entities in outDimTags. If the numElements vector is not empty, also extrude the mesh: the entries in numElements give the number of elements in each layer. If the height vector is not empty, it provides the (cumulative) height of the different layers, normalized to 1. If recombine is set, recombine the mesh in the layers.

Input:  

| dimTags (vector of pairs of integers), x (double), y (double), z (double), ax (double), ay (double), az (double), angle (double), numElements = [] (vector of integers), heights = [] (vector of doubles), recombine = False (boolean) |

Output:  

| outDimTags (vector of pairs of integers) |

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t3.cpp), Python (t3.py)

**gmsh/model/geo/twist**

Extrude the entities dimTags (given as a vector of (dim, tag) pairs) in the built-in CAD representation, using a combined translation and rotation of angle radians,
along \((dx, dy, dz)\) and around the axis of revolution defined by the point \((x, y, z)\) and the direction \((ax, ay, az)\). The angle should be strictly smaller than \(\pi\). Return extruded entities in \texttt{outDimTags}. If the \texttt{numElements} vector is not empty, also extrude the mesh: the entries in \texttt{numElements} give the number of elements in each layer. If the \texttt{height} vector is not empty, it provides the (cumulative) height of the different layers, normalized to 1. If \texttt{recombine} is set, recombine the mesh in the layers.

**Input:**
- \texttt{dimTags} (vector of pairs of integers), \(x\) (double), \(y\) (double), \(z\) (double), \(dx\) (double), \(dy\) (double), \(dz\) (double), \(ax\) (double), \(ay\) (double), \(az\) (double), \(angle\) (double), \texttt{numElements} = \[\] (vector of integers), \texttt{heights} = \[\] (vector of doubles), \texttt{recombine} = \texttt{False} (boolean)

**Output:** \texttt{outDimTags} (vector of pairs of integers)

**Return:** -

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:** C++ (t3.cpp), Python (t3.py)

### gmsh/model/geo/extrudeBoundaryLayer

Extrude the entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) in the built-in CAD representation along the normals of the mesh, creating discrete boundary layer entities. Return extruded entities in \texttt{outDimTags}. The entries in \texttt{numElements} give the number of elements in each layer. If the \texttt{height} vector is not empty, it provides the (cumulative) height of the different layers. If \texttt{recombine} is set, recombine the mesh in the layers. A second boundary layer can be created from the same entities if \texttt{second} is set. If \texttt{viewIndex} is \(\geq 0\), use the corresponding view to either specify the normals (if the view contains a vector field) or scale the normals (if the view is scalar).

**Input:**
- \texttt{dimTags} (vector of pairs of integers), \texttt{numElements} = \[1\] (vector of integers), \texttt{heights} = \[\] (vector of doubles), \texttt{recombine} = \texttt{False} (boolean), \texttt{second} = \texttt{False} (boolean), \texttt{viewIndex} = \(-1\) (integer)

**Output:** \texttt{outDimTags} (vector of pairs of integers)

**Return:** -

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:** Python (aneurysm.py, naca_boundary_layer_2d.py, naca_boundary_layer_3d.py, tube_boundary_layer.py)

### gmsh/model/geo/translate

Translate the entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) in the built-in CAD representation along \((dx, dy, dz)\).

**Input:**
- \texttt{dimTags} (vector of pairs of integers), \(dx\) (double), \(dy\) (double), \(dz\) (double)

**Output:** -

**Return:** -

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:** C++ (t2.cpp), Python (t2.py)
gmsh/model/geo/rotate
Rotate the entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) in the built-in CAD representation by \texttt{angle} radians around the axis of revolution defined by the point \((x, y, z)\) and the direction \((ax, ay, az)\).

Input: \hspace{1em} \texttt{dimTags} (vector of pairs of integers), \(x\) (double), \(y\) (double), \(z\) (double), \(ax\) (double), \(ay\) (double), \(az\) (double), \texttt{angle} (double)

Output: -
Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++ (t2.cpp)}, \texttt{Python (t2.py)}

gmsh/model/geo/dilate
Scale the entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) in the built-in CAD representation by factors \(a\), \(b\) and \(c\) along the three coordinate axes; use \((x, y, z)\) as the center of the homothetic transformation.

Input: \hspace{1em} \texttt{dimTags} (vector of pairs of integers), \(x\) (double), \(y\) (double), \(z\) (double), \(a\) (double), \(b\) (double), \(c\) (double)

Output: -
Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

gmsh/model/geo/mirror
Mirror the entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) in the built-in CAD representation, with respect to the plane of equation \(a \times x + b \times y + c \times z + d = 0\).

Input: \hspace{1em} \texttt{dimTags} (vector of pairs of integers), \(a\) (double), \(b\) (double), \(c\) (double), \(d\) (double)

Output: -
Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

gmsh/model/geo/symmetrize
Mirror the entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) in the built-in CAD representation, with respect to the plane of equation \(a \times x + b \times y + c \times z + d = 0\). (This is a synonym for \texttt{mirror}, which will be deprecated in a future release.)

Input: \hspace{1em} \texttt{dimTags} (vector of pairs of integers), \(a\) (double), \(b\) (double), \(c\) (double), \(d\) (double)

Output: -
Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

gmsh/model/geo/copy
Copy the entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) in the built-in CAD representation; the new entities are returned in \texttt{outDimTags}.
Input: \texttt{dimTags} (vector of pairs of integers)
Output: \texttt{outDimTags} (vector of pairs of integers)
Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++ (t2.cpp)}, \texttt{Python (t2.py)}

\texttt{gmsh/model/geo/remove}
Remove the entities \texttt{dimTags} (given as a vector of (dim, tag) pairs) in the built-in CAD representation, provided that they are not on the boundary of higher-dimensional entities. If \texttt{recursive} is true, remove all the entities on their boundaries, down to dimension 0.

Input: \texttt{dimTags} (vector of pairs of integers), \texttt{recursive = False} (boolean)
Output: -
Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++ (t6.cpp)}, \texttt{Python (t6.py)}

\texttt{gmsh/model/geo/removeAllDuplicates}
Remove all duplicate entities in the built-in CAD representation (different entities at the same geometrical location).

Input: -
Output: -
Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/geo/splitCurve}
Split the curve of tag \texttt{tag} in the built-in CAD representation, on the specified control points \texttt{pointTags}. This feature is only available for lines, splines and b-splines. Return the tag(s) \texttt{curveTags} of the newly created curve(s).

Input: \texttt{tag} (integer), \texttt{pointTags} (vector of integers)
Output: \texttt{curveTags} (vector of integers)
Return: -

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/geo/getMaxTag}
Get the maximum tag of entities of dimension \texttt{dim} in the built-in CAD representation.

Input: \texttt{dim} (integer)
Output: -
Return: integer
Language-specific definition:

\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/geo/setMaxTag}

Set the maximum tag \texttt{maxTag} for entities of dimension \texttt{dim} in the built-in CAD representation.

\textbf{Input:} \texttt{dim} (integer), \texttt{maxTag} (integer)

\textbf{Output:} -

\textbf{Return:} -

Language-specific definition:

\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/geo/addPhysicalGroup}

Add a physical group of dimension \texttt{dim}, grouping the entities with tags \texttt{tags} in the built-in CAD representation. Return the tag of the physical group, equal to \texttt{tag} if \texttt{tag} is positive, or a new tag if \texttt{tag < 0}. Set the name of the physical group if \texttt{name} is not empty.

\textbf{Input:} \texttt{dim} (integer), \texttt{tags} (vector of integers), \texttt{tag = -1} (integer), \texttt{name = ""} (string)

\textbf{Output:} -

\textbf{Return:} integer

Language-specific definition:

\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++ (t5.cpp)}, \texttt{Python (t5.py)}

\texttt{gmsh/model/geo/removePhysicalGroups}

Remove the physical groups \texttt{dimTags} (given as a vector of (\texttt{dim}, \texttt{tag}) pairs) from the built-in CAD representation. If \texttt{dimTags} is empty, remove all groups.

\textbf{Input:} \texttt{dimTags = []} (vector of pairs of integers)

\textbf{Output:} -

\textbf{Return:} -

Language-specific definition:

\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

\texttt{gmsh/model/geo/synchronize}

Synchronize the built-in CAD representation with the current Gmsh model. This can be called at any time, but since it involves a non trivial amount of processing, the number of synchronization points should normally be minimized. Without synchronization the entities in the built-in CAD representation are not available to any function outside of the built-in CAD kernel functions.

\textbf{Input:} -

\textbf{Output:} -

\textbf{Return:} -

Language-specific definition:

\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++ (t1.cpp, t2.cpp, t3.cpp, t5.cpp, t6.cpp, ...), Python (t1.py, t2.py, t3.py, t5.py, t6.py, ...)}
6.7 Namespace gmsh/model/geo/mesh: built-in CAD kernel meshing constraints

gmsh/model/geo/mesh/setSize
Set a mesh size constraint on the entities dimTags (given as a vector of (dim, tag) pairs) in the built-in CAD kernel representation. Currently only entities of dimension 0 (points) are handled.

Input:  \textbf{dimTags} (vector of pairs of integers), \textbf{size} (double)
Output: -
Return: -

Language-specific definition:
\textbf{C++}, \textbf{C}, \textbf{Python}, \textbf{Julia}

Examples: \textbf{C++} (t2.cpp, t15.cpp), \textbf{Python} (t2.py, t15.py)

gmsh/model/geo/mesh/setTransfiniteCurve
Set a transfinite meshing constraint on the curve \textbf{tag} in the built-in CAD kernel representation, with \textbf{numNodes} nodes distributed according to \textbf{meshType} and \textbf{coef}. Currently supported types are "Progression" (geometrical progression with power coef) and "Bump" (refinement toward both extremities of the curve).

Input:  \textbf{tag} (integer), \textbf{nPoints} (integer), \textbf{meshType} = "Progression" (string), \textbf{coef} = 1. (double)
Output: -
Return: -

Language-specific definition:
\textbf{C++}, \textbf{C}, \textbf{Python}, \textbf{Julia}

Examples: \textbf{C++} (t6.cpp), \textbf{Python} (t6.py)

gmsh/model/geo/mesh/setTransfiniteSurface
Set a transfinite meshing constraint on the surface \textbf{tag} in the built-in CAD kernel representation. \textbf{arrangement} describes the arrangement of the triangles when the surface is not flagged as recombined: currently supported values are "Left", "Right", "AlternateLeft" and "AlternateRight". \textbf{cornerTags} can be used to specify the (3 or 4) corners of the transfinite interpolation explicitly; specifying the corners explicitly is mandatory if the surface has more than 3 or 4 points on its boundary.

Input:  \textbf{tag} (integer), \textbf{arrangement} = "Left" (string), \textbf{cornerTags} = [] (vector of integers)
Output: -
Return: -

Language-specific definition:
\textbf{C++}, \textbf{C}, \textbf{Python}, \textbf{Julia}

Examples: \textbf{C++} (t6.cpp), \textbf{Python} (t6.py)

gmsh/model/geo/mesh/setTransfiniteVolume
Set a transfinite meshing constraint on the surface \textbf{tag} in the built-in CAD kernel representation. \textbf{cornerTags} can be used to specify the (6 or 8) corners of the transfinite interpolation explicitly.

Input:  \textbf{tag} (integer), \textbf{cornerTags} = [] (vector of integers)
Output: -
gmsh/model/geo/mesh/setRecombine
Set a recombination meshing constraint on the entity of dimension $\text{dim}$ and tag $\text{tag}$ in the built-in CAD kernel representation. Currently only entities of dimension 2 (to recombine triangles into quadrangles) are supported; $\text{angle}$ specifies the threshold angle for the simple recombination algorithm.

Input: $\text{dim}$ (integer), $\text{tag}$ (integer), $\text{angle}$ = 45. (double)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t6.cpp), Python (t6.py)

gmsh/model/geo/mesh/setSmoothing
Set a smoothing meshing constraint on the entity of dimension $\text{dim}$ and tag $\text{tag}$ in the built-in CAD kernel representation. $\text{val}$ iterations of a Laplace smoother are applied.

Input: $\text{dim}$ (integer), $\text{tag}$ (integer), $\text{val}$ (integer)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh/model/geo/mesh/setReverse
Set a reverse meshing constraint on the entity of dimension $\text{dim}$ and tag $\text{tag}$ in the built-in CAD kernel representation. If $\text{val}$ is true, the mesh orientation will be reversed with respect to the natural mesh orientation (i.e. the orientation consistent with the orientation of the geometry). If $\text{val}$ is false, the mesh is left as-is.

Input: $\text{dim}$ (integer), $\text{tag}$ (integer), $\text{val}$ = True (boolean)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh/model/geo/mesh/setAlgorithm
Set the meshing algorithm on the entity of dimension $\text{dim}$ and tag $\text{tag}$ in the built-in CAD kernel representation. Currently only supported for $\text{dim} == 2$.

Input: $\text{dim}$ (integer), $\text{tag}$ (integer), $\text{val}$ (integer)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia
Chapter 6: Gmsh application programming interface

gmsh/model/geo/mesh/setSizeFromBoundary
Force the mesh size to be extended from the boundary, or not, for the entity of dimension \( \text{dim} \) and tag \( \text{tag} \) in the built-in CAD kernel representation. Currently only supported for \( \text{dim} == 2 \).

Input: \( \text{dim} \) (integer), \( \text{tag} \) (integer), \( \text{val} \) (integer)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

6.8 Namespace gmsh/model/occ: OpenCASCADE CAD kernel functions

gmsh/model/occ/addPoint
Add a geometrical point in the OpenCASCADE CAD representation, at coordinates \((x, y, z)\). If \( \text{meshSize} \) is \( > 0 \), add a meshing constraint at that point. If \( \text{tag} \) is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the point. (Note that the point will be added in the current model only after \text{synchronize} is called. This behavior holds for all the entities added in the \text{occ} module.)

Input: \( x \) (double), \( y \) (double), \( z \) (double), \( \text{meshSize} = 0 \). (double), \( \text{tag} = -1 \) (integer)
Output: -
Return: integer
Language-specific definition:
C++, C, Python, Julia
Examples: C++ (t19.cpp), Python (t19.py, bspline_bezier_patches.py, bspline_bezier_trimmed.py, bspline_filling.py, circle_arc.py, ...)

gmsh/model/occ/addLine
Add a straight line segment in the OpenCASCADE CAD representation, between the two points with tags \( \text{startTag} \) and \( \text{endTag} \). If \( \text{tag} \) is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the line.

Input: \( \text{startTag} \) (integer), \( \text{endTag} \) (integer), \( \text{tag} = -1 \) (integer)
Output: -
Return: integer
Language-specific definition:
C++, C, Python, Julia
Examples: Python (crack.py, naca_boundary_layer_2d.py, naca_boundary_layer_3d.py, relocate_nodes.py, stl_to_brep.py)

gmsh/model/occ/addCircleArc
Add a circle arc in the OpenCASCADE CAD representation, between the two points with tags \( \text{startTag} \) and \( \text{endTag} \), with middle point \( \text{middleTag} \). If \( \text{center} \) is true, the middle point is the center of the circle; otherwise the circle goes through the middle point. If \( \text{tag} \) is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the circle arc.
Input: \( \text{startTag} \) (integer), \( \text{middleTag} \) (integer), \( \text{endTag} \) (integer), \( \text{tag} = -1 \) (integer), \( \text{center} = \text{True} \) (boolean)

Output: -

Return: integer

Language-specific definition:

\( \text{C++, C, Python, Julia} \)

Examples: Python \((\text{circle_arc.py, naca_boundary_layer_2d.py, naca_boundary_layer_3d.py})\)

\textbf{gmsh/model/occ/addCircle}

Add a circle of center \((x, y, z)\) and radius \(r\) in the OpenCASCADE CAD representation. If \(\text{tag}\) is positive, set the tag explicitly; otherwise a new tag is selected automatically. If \(\text{angle1}\) and \(\text{angle2}\) are specified, create a circle arc between the two angles. If a vector \(\text{zAxis}\) of size 3 is provided, use it as the normal to the circle plane (z-axis). If a vector \(\text{xAxis}\) of size 3 is provided in addition to \(\text{zAxis}\), use it to define the x-axis. Return the tag of the circle.

Input: \(x\) (double), \(y\) (double), \(z\) (double), \(r\) (double), \(\text{tag} = -1\) (integer), \(\text{angle1} = 0.\) (double), \(\text{angle2} = 2\pi\) (double), \(\text{zAxis} = []\) (vector of doubles), \(\text{xAxis} = []\) (vector of doubles)

Output: -

Return: integer

Language-specific definition:

\( \text{C++, C, Python, Julia} \)

Examples: C++ \((\text{t19.cpp})\), Python \((\text{t19.py, bsplineBezier_trimmed.py, closest_point.py, prim_axis.py, trimmed.py})\)

\textbf{gmsh/model/occ/addEllipseArc}

Add an ellipse arc in the OpenCASCADE CAD representation, between the two points \(\text{startTag}\) and \(\text{endTag}\), and with center \(\text{centerTag}\) and major axis point \(\text{majorTag}\). If \(\text{tag}\) is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the ellipse arc. Note that OpenCASCADE does not allow creating ellipse arcs with the major radius smaller than the minor radius.

Input: \(\text{startTag}\) (integer), \(\text{centerTag}\) (integer), \(\text{majorTag}\) (integer), \(\text{endTag}\) (integer), \(\text{tag} = -1\) (integer)

Output: -

Return: integer

Language-specific definition:

\( \text{C++, C, Python, Julia} \)

\textbf{gmsh/model/occ/addEllipse}

Add an ellipse of center \((x, y, z)\) and radii \(r_1\) and \(r_2\) (with \(r_1 \geq r_2\)) along the x- and y-axes, respectively, in the OpenCASCADE CAD representation. If \(\text{tag}\) is positive, set the tag explicitly; otherwise a new tag is selected automatically. If \(\text{angle1}\) and \(\text{angle2}\) are specified, create an ellipse arc between the two angles. If a vector \(\text{zAxis}\) of size 3 is provided, use it as the normal to the ellipse plane (z-axis). If a vector \(\text{xAxis}\) of size 3 is provided in addition to \(\text{zAxis}\), use it to define the x-axis. Return the tag of the ellipse.

Input: \(\text{startTag}\) (integer), \(\text{middleTag}\) (integer), \(\text{endTag}\) (integer), \(\text{tag} = -1\) (integer), \(\text{center} = \text{True} \) (boolean)

Output: -

Return: integer

Language-specific definition:

\( \text{C++, C, Python, Julia} \)
Input: \( x \) (double), \( y \) (double), \( z \) (double), \( r_1 \) (double), \( r_2 \) (double), \( \text{tag} = -1 \) (integer), \( \text{angle1} = 0. \) (double), \( \text{angle2} = 2\pi \) (double), \( \text{zAxis} = [] \) (vector of doubles), \( \text{xAxis} = [] \) (vector of doubles)

Output: -

Return: integer

Language-specific definition:

C++, C, Python, Julia

Examples: Python (prim_axis.py)

\texttt{gmsh/model/occ/addSpline}

Add a spline (C2 b-spline) curve in the OpenCASCADE CAD representation, going through the points \texttt{pointTags}. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Create a periodic curve if the first and last points are the same. Return the tag of the spline curve. If the \texttt{tangents} vector contains 6 entries, use them as concatenated \( x, y, z \) components of the initial and final tangents of the b-spline; if it contains 3 times as many entries as the number of points, use them as concatenated \( x, y, z \) components of the tangents at each point, unless the norm of the tangent is zero.

Input: \texttt{pointTags} (vector of integers), \texttt{tag} = -1 (integer), \texttt{tangents} = [] (vector of doubles)

Output: -

Return: integer

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (t19.cpp), Python (t19.py, naca_boundary_layer_2d.py, naca_boundary_layer_3d.py, pipe.py, spline.py, ...)

\texttt{gmsh/model/occ/addBSpline}

Add a b-spline curve of degree \texttt{degree} in the OpenCASCADE CAD representation, with \texttt{pointTags} control points. If \texttt{weights}, \texttt{knots} or \texttt{multiplicities} are not provided, default parameters are computed automatically. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Create a periodic curve if the first and last points are the same. Return the tag of the b-spline curve.

Input: \texttt{pointTags} (vector of integers), \texttt{tag} = -1 (integer), \texttt{degree} = 3 (integer), \texttt{weights} = [] (vector of doubles), \texttt{knots} = [] (vector of doubles), \texttt{multiplicities} = [] (vector of integers)

Output: -

Return: integer

Language-specific definition:

C++, C, Python, Julia

Examples: Python (bspline_filling.py, spline.py)

\texttt{gmsh/model/occ/addBezier}

Add a Bezier curve in the OpenCASCADE CAD representation, with \texttt{pointTags} control points. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the Bezier curve.

Input: \texttt{pointTags} (vector of integers), \texttt{tag} = -1 (integer)
Output: -
Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (spline.py)

gmsh/model/occ/addWire
Add a wire (open or closed) in the OpenCASCADE CAD representation, formed by the curves curveTags. Note that an OpenCASCADE wire can be made of curves that share geometrically identical (but topologically different) points. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the wire.

Input: curveTags (vector of integers), tag = -1 (integer), checkClosed = False (boolean)

Output: -
Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t19.cpp), Python (t19.py, bspline_bezier.trimmed.py, bspline_filling.py, pipe.py, trimmed.py)

gmsh/model/occ/addCurveLoop
Add a curve loop (a closed wire) in the OpenCASCADE CAD representation, formed by the curves curveTags. curveTags should contain tags of curves forming a closed loop. Negative tags can be specified for compatibility with the built-in kernel, but are simply ignored: the wire is oriented according to the orientation of its first curve. Note that an OpenCASCADE curve loop can be made of curves that share geometrically identical (but topologically different) points. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the curve loop.

Input: curveTags (vector of integers), tag = -1 (integer)

Output: -
Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t19.cpp), Python (t19.py, naca_boundary_layer_2d.py, relocate_nodes.py, stl_to_brep.py, surface_filling.py)

gmsh/model/occ/addRectangle
Add a rectangle in the OpenCASCADE CAD representation, with lower left corner at \((x, y, z)\) and upper right corner at \((x + dx, y + dy, z)\). If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Round the corners if roundedRadius is nonzero. Return the tag of the rectangle.

Input: \(x\) (double), \(y\) (double), \(z\) (double), \(dx\) (double), \(dy\) (double), tag = -1 (integer), roundedRadius = 0. (double)

Output: -
Return: integer
Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t17.cpp, t20.cpp, t21.cpp, x6.cpp), Python (t17.py, t20.py, t21.py, x6.py, adapt_mesh.py, ...)

`gmsh/model/occ/addDisk`

Add a disk in the OpenCASCADE CAD representation, with center \((xc, yc, zc)\) and radius \(rx\) along the x-axis and \(ry\) along the y-axis \((rx \geq ry)\). If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. If a vector \(zAxis\) of size 3 is provided, use it as the normal to the disk (z-axis). If a vector \(xAxis\) of size 3 is provided in addition to \(zAxis\), use it to define the x-axis. Return the tag of the disk.

Input: \(xc\) (double), \(yc\) (double), \(zc\) (double), \(rx\) (double), \(ry\) (double), tag = -1 (integer), \(zAxis = []\) (vector of doubles), \(xAxis = []\) (vector of doubles)

Output: -

Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t19.cpp), Python (t19.py, pipe.py, poisson.py, prim_axis.py)

`gmsh/model/occ/addPlaneSurface`

Add a plane surface in the OpenCASCADE CAD representation, defined by one or more curve loops (or closed wires) \(wireTags\). The first curve loop defines the exterior contour; additional curve loop define holes. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the surface.

Input: \(wireTags\) (vector of integers), tag = -1 (integer)

Output: -

Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (naca_boundary_layer_2d.py, stl_to_brep.py)

`gmsh/model/occ/addSurfaceFilling`

Add a surface in the OpenCASCADE CAD representation, filling the curve loop \(wireTag\). If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the surface. If \(pointTags\) are provided, force the surface to pass through the given points. The other optional arguments are degree (the degree of the energy criterion to minimize for computing the deformation of the surface), numPointsOnCurves (the average number of points for discretisation of the bounding curves), numIter (the maximum number of iterations of the optimization process), anisotropic (improve performance when the ratio of the length along the two parametric coordinates of the surface is high), tol2d (tolerance to the constraints in the parametric plane of the surface), tol3d (the maximum distance allowed between the support surface and the constraints), tolAng (the maximum angle allowed between the normal of the surface and the constraints), tolCurv (the maximum difference of curvature allowed between the surface and the constraint), maxDegree (the highest degree which the polynomial defining the filling surface can
have) and, `maxSegments` (the largest number of segments which the filling surface can have).

**Input:**
- `wireTag` (integer), `tag = -1` (integer), `pointTags = []` (vector of integers), `degree = 3` (integer), `numPointsOnCurves = 15` (integer), `numIter = 2` (integer), `anisotropic = False` (boolean), `tol2d = 0.00001` (double), `tol3d = 0.0001` (double), `tolAng = 0.01` (double), `tolCurv = 0.1` (double), `maxDegree = 8` (integer), `maxSegments = 9` (integer)

**Output:**
- integer

**Return:**
- integer

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:**
- Python (`relocate_nodes.py`, `surface_filling.py`)

**gmsh/model/occ/addBSplineFilling**

Add a BSpline surface in the OpenCASCADE CAD representation, filling the curve loop `wireTag`. The curve loop should be made of 2, 3 or 4 curves. The optional `type` argument specifies the type of filling: "Stretch" creates the flattest patch, "Curved" (the default) creates the most rounded patch, and "Coons" creates a rounded patch with less depth than "Curved". If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the surface.

**Input:**
- `wireTag` (integer), `tag = -1` (integer), `type = ""` (string)

**Output:**
- integer

**Return:**
- integer

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:**
- Python (`bspline_filling.py`, `surface_filling.py`)

**gmsh/model/occ/addBezierFilling**

Add a Bezier surface in the OpenCASCADE CAD representation, filling the curve loop `wireTag`. The curve loop should be made of 2, 3 or 4 Bezier curves. The optional `type` argument specifies the type of filling: "Stretch" creates the flattest patch, "Curved" (the default) creates the most rounded patch, and "Coons" creates a rounded patch with less depth than "Curved". If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the surface.

**Input:**
- `wireTag` (integer), `tag = -1` (integer), `type = ""` (string)

**Output:**
- integer

**Return:**
- integer

**Language-specific definition:**
- C++, C, Python, Julia

**Examples:**
- Python (`bspline_filling.py`, `surface_filling.py`)

**gmsh/model/occ/addBSplineSurface**

Add a b-spline surface of degree `degreeU x degreeV` in the OpenCASCADE CAD representation, with `pointTags` control points given as a single vector `[P1v1, ..., Pu1v1, ..., Pu1v2, ..., Pu2v1, ..., Pu2v2, ...]`. If `weights`, `knotsU`, `knotsV`, `multiplicitiesU` or `multiplicitiesV` are not provided, default parameters are computed automatically.
If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. 
If `wireTags` is provided, trim the b-spline patch using the provided wires: the first wire defines the external contour, the others define holes. If `wire3D` is set, consider wire curves as 3D curves and project them on the b-spline surface; otherwise consider the wire curves as defined in the parametric space of the surface. Return the tag of the b-spline surface.

Input: 
- `pointTags` (vector of integers)
- `numPointsU` (integer)
- `tag` = -1 (integer)
- `degreeU` = 3 (integer)
- `degreeV` = 3 (integer)
- `weights` = [] (vector of doubles)
- `knotsU` = [] (vector of doubles)
- `knotsV` = [] (vector of doubles)
- `multiplicitiesU` = [] (vector of integers)
- `multiplicitiesV` = [] (vector of integers)
- `wireTags` = [] (vector of integers)
- `wire3D` = False (boolean)

Output: -
Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (bspline_bezier_patches.py, bspline_bezier_trimmed.py, terrain_bspline.py)

`gmsh/model/occ/addBezierSurface`
Add a Bezier surface in the OpenCASCADE CAD representation, with `pointTags` control points given as a single vector `[Pu1v1, ... Pu numPointsUv1, Pu1v2, ...]`. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. If `wireTags` is provided, trim the Bezier patch using the provided wires: the first wire defines the external contour, the others define holes. If `wire3D` is set, consider wire curves as 3D curves and project them on the Bezier surface; otherwise consider the wire curves as defined in the parametric space of the surface. Return the tag of the Bezier surface.

Input: 
- `pointTags` (vector of integers)
- `numPointsU` (integer)
- `tag` = -1 (integer)
- `wireTags` = [] (vector of integers)
- `wire3D` = False (boolean)

Output: -
Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (bspline_bezier_patches.py)

`gmsh/model/occ/addTrimmedSurface`
Trim the surface `surfaceTag` with the wires `wireTags`, replacing any existing trimming curves. The first wire defines the external contour, the others define holes. If `wire3D` is set, consider wire curves as 3D curves and project them on the surface; otherwise consider the wire curves as defined in the parametric space of the surface. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the trimmed surface.

Input: 
- `surfaceTag` (integer)
- `wireTags` = [] (vector of integers)
- `wire3D` = False (boolean)
- `tag` = -1 (integer)

Output: -
Return: integer
Language-specific definition:
   C++, C, Python, Julia

Examples: Python (trimmed.py)

gmsh/model/occ/addSurfaceLoop
Add a surface loop (a closed shell) in the OpenCASCADE CAD representation, formed by surfaceTags. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the surface loop. Setting sewing allows one to build a shell made of surfaces that share geometrically identical (but topologically different) curves.

Input:    surfaceTags (vector of integers), tag = -1 (integer), sewing = False (boolean)
Output:   -
Return:   integer

Language-specific definition:
   C++, C, Python, Julia

Examples: Python (stl_to_brep.py)

gmsh/model/occ/addVolume
Add a volume (a region) in the OpenCASCADE CAD representation, defined by one or more surface loops shellTags. The first surface loop defines the exterior boundary; additional surface loop define holes. If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the volume.

Input:    shellTags (vector of integers), tag = -1 (integer)
Output:   -
Return:   integer

Language-specific definition:
   C++, C, Python, Julia

Examples: Python (stl_to_brep.py)

gmsh/model/occ/addSphere
Add a sphere of center (xc, yc, zc) and radius r in the OpenCASCADE CAD representation. The optional angle1 and angle2 arguments define the polar angle opening (from -Pi/2 to Pi/2). The optional angle3 argument defines the azimuthal opening (from 0 to 2*Pi). If tag is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the sphere.

Input:    xc (double), yc (double), zc (double), radius (double), tag = -1 (integer), angle1 = -pi/2 (double), angle2 = pi/2 (double), angle3 = 2*pi (double)
Output:   -
Return:   integer

Language-specific definition:
   C++, C, Python, Julia

Examples: C++ (t16.cpp, t18.cpp, x5.cpp), Python (t16.py, t18.py, x5.py, boolean.py, extend_field.py, ...)
Chapter 6: Gmsh application programming interface

\textit{gmsh/model/occ/addBox}\n
Add a parallelepipedic box in the OpenCASCADE CAD representation, defined by a point \((x, y, z)\) and the extents along the \(x\)-, \(y\)- and \(z\)-axes. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the box.

\textbf{Input:} \(x\) (double), \(y\) (double), \(z\) (double), \(dx\) (double), \(dy\) (double), \(dz\) (double), \texttt{tag} = -1 (integer)

\textbf{Output:} -

\textbf{Return:} integer

Language-specific definition:
\begin{itemize}
\item C++, C, Python, Julia
\end{itemize}

Examples: C++ (t16.cpp, t18.cpp, x4.cpp, x5.cpp, x7.cpp), Python (t16.py, t18.py, x4.py, x5.py, x7.py, ...)

\textit{gmsh/model/occ/addCylinder}\n
Add a cylinder in the OpenCASCADE CAD representation, defined by the center \((x, y, z)\) of its first circular face, the 3 components \((dx, dy, dz)\) of the vector defining its axis and its radius \(r\). The optional \texttt{angle} argument defines the angular opening (from 0 to 2*Pi). If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. Return the tag of the cylinder.

\textbf{Input:} \(x\) (double), \(y\) (double), \(z\) (double), \(dx\) (double), \(dy\) (double), \(dz\) (double), \(r\) (double), \texttt{tag} = -1 (integer), \texttt{angle} = 2*pi (double)

\textbf{Output:} -

\textbf{Return:} integer

Language-specific definition:
\begin{itemize}
\item C++, C, Python, Julia
\end{itemize}

Examples: Python (boolean.py, gui.py, tube_boundary_layer.py)

\textit{gmsh/model/occ/addCone}\n
Add a cone in the OpenCASCADE CAD representation, defined by the center \((x, y, z)\) of its first circular face, the 3 components of the vector \((dx, dy, dz)\) defining its axis and the two radii \(r1\) and \(r2\) of the faces (these radii can be zero). If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. \texttt{angle} defines the optional angular opening (from 0 to 2*Pi). Return the tag of the cone.

\textbf{Input:} \(x\) (double), \(y\) (double), \(z\) (double), \(dx\) (double), \(dy\) (double), \(dz\) (double), \(r1\) (double), \(r2\) (double), \texttt{tag} = -1 (integer), \texttt{angle} = 2*pi (double)

\textbf{Output:} -

\textbf{Return:} integer

Language-specific definition:
\begin{itemize}
\item C++, C, Python, Julia
\end{itemize}

Examples: C++ (x1.cpp), Python (x1.py)

\textit{gmsh/model/occ/addWedge}\n
Add a right angular wedge in the OpenCASCADE CAD representation, defined by the right-angle point \((x, y, z)\) and the 3 extends along the \(x\)-, \(y\)- and \(z\)-axes \((dx, dy, dz)\). If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. The optional argument \texttt{ltx} defines the top extent along the \(x\)-axis.
If a vector \texttt{zAxis} of size 3 is provided, use it to define the z-axis. Return the tag of the wedge.

| Input: | 
| x (double), y (double), z (double), dx (double), dy (double), dz (double), tag = -1 (integer), ltx = 0. (double), zAxis = [] (vector of doubles) |
| Output: | - |
| Return: | integer |

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{Python} (\texttt{prim_axis.py})

\texttt{gmsh/model/occ/addTorus}

Add a torus in the OpenCASCADE CAD representation, defined by its center \texttt{(x, y, z)} and its 2 radii \texttt{r} and \texttt{r2}. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. The optional argument \texttt{angle} defines the angular opening (from 0 to 2*\texttt{Pi}). If a vector \texttt{zAxis} of size 3 is provided, use it to define the z-axis. Return the tag of the torus.

| Input: | 
| x (double), y (double), z (double), r1 (double), r2 (double), tag = -1 (integer), angle = 2*pi (double), zAxis = [] (vector of doubles) |
| Output: | - |
| Return: | integer |

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{Python} (\texttt{prim_axis.py})

\texttt{gmsh/model/occ/addThruSections}

Add a volume (if the optional argument \texttt{makeSolid} is set) or surfaces in the OpenCASCADE CAD representation, defined through the open or closed wires \texttt{wireTags}. If \texttt{tag} is positive, set the tag explicitly; otherwise a new tag is selected automatically. The new entities are returned in \texttt{outDimTags} as a vector of \texttt{(dim, tag)} pairs. If the optional argument \texttt{makeRuled} is set, the surfaces created on the boundary are forced to be ruled surfaces. If \texttt{maxDegree} is positive, set the maximal degree of resulting surface. The optional argument \texttt{continuity} allows to specify the continuity of the resulting shape ("C0", "G1", "C1", "G2", "C2", "C3", "CN"). The optional argument \texttt{parametrization} sets the parametrization type ("ChordLength", "Centripetal", "IsoParametric"). The optional argument \texttt{smoothing} determines if smoothing is applied.

| Input: | 
| wireTags (vector of integers), tag = -1 (integer), makeSolid = True (boolean), makeRuled = False (boolean), maxDegree = -1 (integer), continuity = "" (string), parametrization = "" (string), smoothing = False (boolean) |
| Output: | outDimTags (vector of pairs of integers) |
| Return: | - |

Language-specific definition:
\texttt{C++}, \texttt{C}, \texttt{Python}, \texttt{Julia}

Examples: \texttt{C++} (\texttt{t19.cpp}), \texttt{Python} (\texttt{t19.py})
gmsh/model/occ/addThickSolid

Add a hollowed volume in the OpenCASCADE CAD representation, built from an initial volume `volumeTag` and a set of faces from this volume `excludeSurfaceTags`, which are to be removed. The remaining faces of the volume become the walls of the hollowed solid, with thickness `offset`. If `tag` is positive, set the tag explicitly; otherwise a new tag is selected automatically.

**Input:**
- `volumeTag` (integer)
- `excludeSurfaceTags` (vector of integers)
- `offset` (double)
- `tag = -1` (integer)

**Output:**
- `outDimTags` (vector of pairs of integers)

**Return:** -

Language-specific definition:
- C++
- C
- Python
- Julia

---

gmsh/model/occ/extrude

Extrude the entities `dimTags` (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation, using a translation along (dx, dy, dz). Return extruded entities in `outDimTags`. If the `numElements` vector is not empty, also extrude the mesh: the entries in `numElements` give the number of elements in each layer. If the `height` vector is not empty, it provides the (cumulative) height of the different layers, normalized to 1. If `recombine` is set, recombine the mesh in the layers.

**Input:**
- `dimTags` (vector of pairs of integers)
- `dx` (double), `dy` (double), `dz` (double)
- `numElements = []` (vector of integers)
- `heights = []` (vector of doubles)
- `recombine = False` (boolean)

**Output:**
- `outDimTags` (vector of pairs of integers)

**Return:** -

Language-specific definition:
- C++
- C
- Python
- Julia

Examples: Python (naca_boundary_layer_3d.py)

---

gmsh/model/occ/revolve

Extrude the entities `dimTags` (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation, using a rotation of `angle` radians around the axis of revolution defined by the point (x, y, z) and the direction (ax, ay, az). Return extruded entities in `outDimTags`. If the `numElements` vector is not empty, also extrude the mesh: the entries in `numElements` give the number of elements in each layer. If the `height` vector is not empty, it provides the (cumulative) height of the different layers, normalized to 1. When the mesh is extruded the angle should be strictly smaller than 2*Pi. If `recombine` is set, recombine the mesh in the layers.

**Input:**
- `dimTags` (vector of pairs of integers)
- `x` (double), `y` (double), `z` (double)
- `ax` (double), `ay` (double), `az` (double)
- `angle` (double)
- `numElements = []` (vector of integers)
- `heights = []` (vector of doubles)
- `recombine = False` (boolean)

**Output:**
- `outDimTags` (vector of pairs of integers)

**Return:** -

Language-specific definition:
- C++
- C
- Python
- Julia
Examples: Python (naca_boundary_layer_3d.py)

gmsh/model/occ/addPipe
Add a pipe in the OpenCASCADE CAD representation, by extruding the entities `dimTags` (given as a vector of (dim, tag) pairs) along the wire `wireTag`. The type of sweep can be specified with `trihedron` (possible values: "DiscreteTrihedron", "CorrectedFrenet", "Fixed", "Frenet", "ConstantNormal", "Darboux", "GuideAC", "GuidePlan", "GuideACWithContact", "GuidePlanWithContact"). If `trihedron` is not provided, "DiscreteTrihedron" is assumed. Return the pipe in `outDimTags`.

Input: `dimTags` (vector of pairs of integers), `wireTag` (integer), `trihedron = ""` (string)

Output: `outDimTags` (vector of pairs of integers)

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t19.cpp), Python (t19.py, pipe.py)

gmsh/model/occ/fillet
Fillet the volumes `volumeTags` on the curves `curveTags` with radii `radii`. The `radii` vector can either contain a single radius, as many radii as `curveTags`, or twice as many as `curveTags` (in which case different radii are provided for the begin and end points of the curves). Return the filleted entities in `outDimTags` as a vector of (dim, tag) pairs. Remove the original volume if `removeVolume` is set.

Input: `volumeTags` (vector of integers), `curveTags` (vector of integers), `radii` (vector of doubles), `removeVolume = True` (boolean)

Output: `outDimTags` (vector of pairs of integers)

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t19.cpp), Python (t19.py)

gmsh/model/occ/chamfer
Chamfer the volumes `volumeTags` on the curves `curveTags` with distances `distances` measured on surfaces `surfaceTags`. The `distances` vector can either contain a single distance, as many distances as `curveTags` and `surfaceTags`, or twice as many as `curveTags` and `surfaceTags` (in which case the first in each pair is measured on the corresponding surface in `surfaceTags`, the other on the other adjacent surface). Return the chamfered entities in `outDimTags`. Remove the original volume if `removeVolume` is set.

Input: `volumeTags` (vector of integers), `curveTags` (vector of integers), `surfaceTags` (vector of integers), `distances` (vector of doubles), `removeVolume = True` (boolean)

Output: `outDimTags` (vector of pairs of integers)

Return: -

Language-specific definition:
C++, C, Python, Julia
gmsh/model/occ/fuse
Compute the boolean union (the fusion) of the entities objectDimTags and toolDimTags (vectors of (dim, tag) pairs) in the OpenCASCADE CAD representation. Return the resulting entities in outDimTags. If tag is positive, try to set the tag explicitly (only valid if the boolean operation results in a single entity). Remove the object if removeObject is set. Remove the tool if removeTool is set.

Input:
- objectDimTags (vector of pairs of integers),
- toolDimTags (vector of pairs of integers),
- tag = -1 (integer),
- removeObject = True (boolean),
- removeTool = True (boolean)

Output:
- outDimTags (vector of pairs of integers),
- outDimTagsMap (vector of vectors of pairs of integers)

Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (x5.cpp), Python (x5.py, boolean.py, gui.py, tube_boundary_layer.py)

gmsh/model/occ/intersect
Compute the boolean intersection (the common parts) of the entities objectDimTags and toolDimTags (vectors of (dim, tag) pairs) in the OpenCASCADE CAD representation. Return the resulting entities in outDimTags. If tag is positive, try to set the tag explicitly (only valid if the boolean operation results in a single entity). Remove the object if removeObject is set. Remove the tool if removeTool is set.

Input:
- objectDimTags (vector of pairs of integers),
- toolDimTags (vector of pairs of integers),
- tag = -1 (integer),
- removeObject = True (boolean),
- removeTool = True (boolean)

Output:
- outDimTags (vector of pairs of integers),
- outDimTagsMap (vector of vectors of pairs of integers)

Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (boolean.py, gui.py)

gmsh/model/occ/cut
Compute the boolean difference between the entities objectDimTags and toolDimTags (given as vectors of (dim, tag) pairs) in the OpenCASCADE CAD representation. Return the resulting entities in outDimTags. If tag is positive, try to set the tag explicitly (only valid if the boolean operation results in a single entity). Remove the object if removeObject is set. Remove the tool if removeTool is set.

Input:
- objectDimTags (vector of pairs of integers),
- toolDimTags (vector of pairs of integers),
- tag = -1 (integer),
- removeObject = True (boolean),
- removeTool = True (boolean)

Output:
- outDimTags (vector of pairs of integers),
- outDimTagsMap (vector of vectors of pairs of integers)

Return: -
Language-specific definition:

C++, C, Python, Julia

Examples: C++ (t16.cpp), Python (t16.py, boolean.py, extend_field.py, gui.py, spherical_surf.py)

**gmsh/model/occ/fragment**

Compute the boolean fragments (general fuse) resulting from the intersection of the entities `objectDimTags` and `toolDimTags` (given as vectors of (dim, tag) pairs) in the OpenCASCADE CAD representation, making all interfaces conformal. When applied to entities of different dimensions, the lower dimensional entities will be automatically embedded in the higher dimensional entities if they are not on their boundary. Return the resulting entities in `outDimTags`. If `tag` is positive, try to set the tag explicitly (only valid if the boolean operation results in a single entity). Remove the object if `removeObject` is set. Remove the tool if `removeTool` is set.

**Input:**
- `objectDimTags` (vector of pairs of integers),
- `toolDimTags` (vector of pairs of integers),
- `tag` = -1 (integer),
- `removeObject` = True (boolean),
- `removeTool` = True (boolean)

**Output:**
- `outDimTags` (vector of pairs of integers),
- `outDimTagsMap` (vector of vectors of pairs of integers)

**Return:** -

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (t16.cpp, t18.cpp, t20.cpp, t21.cpp), Python (t16.py, t18.py, t20.py, t21.py, bspline_bezier_patches.py, ...)

**gmsh/model/occ/translate**

Translate the entities `dimTags` (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation along (`dx`, `dy`, `dz`).

**Input:**
- `dimTags` (vector of pairs of integers),
- `dx` (double),
- `dy` (double),
- `dz` (double)

**Output:** -

**Return:** -

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (t19.cpp, t20.cpp), Python (t19.py, t20.py)

**gmsh/model/occ/rotate**

Rotate the entities `dimTags` (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation by `angle` radians around the axis of revolution defined by the point (`x`, `y`, `z`) and the direction (`ax`, `ay`, `az`).

**Input:**
- `dimTags` (vector of pairs of integers),
- `x` (double),
- `y` (double),
- `z` (double),
- `ax` (double),
- `ay` (double),
- `az` (double),
- `angle` (double)

**Output:** -

**Return:** -

Language-specific definition:

C++, C, Python, Julia
Examples: C++ (t19.cpp, t20.cpp), Python (t19.py, t20.py, naca_boundary_layer_2d.py, naca_boundary_layer_3d.py, pipe.py)

gmsh/model/occ/dilate
Scale the entities dimTags (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation by factors a, b and c along the three coordinate axes; use (x, y, z) as the center of the homothetic transformation.
Input: dimTags (vector of pairs of integers), x (double), y (double), z (double), a (double), b (double), c (double)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/occ/mirror
Mirror the entities dimTags (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation, with respect to the plane of equation a * x + b * y + c * z + d = 0.
Input: dimTags (vector of pairs of integers), a (double), b (double), c (double), d (double)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/occ/symmetrize
Mirror the entities dimTags (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation, with respect to the plane of equation a * x + b * y + c * z + d = 0. (This is a deprecated synonym for mirror.)
Input: dimTags (vector of pairs of integers), a (double), b (double), c (double), d (double)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia

gmsh/model/occ/affineTransform
Apply a general affine transformation matrix affineTransform (16 entries of a 4x4 matrix, by row; only the 12 first can be provided for convenience) to the entities dimTags (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation.
Input: dimTags (vector of pairs of integers), affineTransform (vector of doubles)
Output: -
Return: -
Language-specific definition:
C++, C, Python, Julia
gmsh/model/occ/copy
Copy the entities dimTags in the OpenCASCADE CAD representation; the new entities are returned in outDimTags.

Input: dimTags (vector of pairs of integers)
Output: outDimTags (vector of pairs of integers)
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t19.cpp, t20.cpp), Python (t19.py, t20.py)

gmsh/model/occ/remove
Remove the entities dimTags (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation, provided that they are not on the boundary of higher-dimensional entities. If recursive is true, remove all the entities on their boundaries, down to dimension 0.

Input: dimTags (vector of pairs of integers), recursive = False (boolean)
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t19.cpp, t20.cpp), Python (t19.py, t20.py, pipe.py, trimmed.py, tube_boundary_layer.py)

gmsh/model/occ/removeAllDuplicates
Remove all duplicate entities in the OpenCASCADE CAD representation (different entities at the same geometrical location) after intersecting (using boolean fragments) all highest dimensional entities.

Input: -
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (bspline bezier patches.py, hybrid_order.py, stl_to_mesh.py)

gmsh/model/occ/healShapes
Apply various healing procedures to the entities dimTags (given as a vector of (dim, tag) pairs), or to all the entities in the model if dimTags is empty, in the OpenCASCADE CAD representation. Return the healed entities in outDimTags.

Input: dimTags = [] (vector of pairs of integers), tolerance = 1e-8 (double), fixDegenerated = True (boolean), fixSmallEdges = True (boolean), fixSmallFaces = True (boolean), sewFaces = True (boolean), makeSolids = True (boolean)
Output: outDimTags (vector of pairs of integers)
Return: -

Language-specific definition:
C++, C, Python, Julia
Examples: Python (bspline_bezier_patches.py, heal.py)

gmsh/model/occ/convertToNURBS
Convert the entities \texttt{dimTags} to NURBS.
Input: \texttt{dimTags} (vector of pairs of integers)
Output: -
Return: -
Language-specific definition:
\texttt{C++}, C, Python, Julia

gmsh/model/occ/importShapes
Import BREP, STEP or IGES shapes from the file \texttt{fileName} in the OpenCASCADE CAD representation. The imported entities are returned in \texttt{outDimTags}, as a vector of (dim, tag) pairs. If the optional argument \texttt{highestDimOnly} is set, only import the highest dimensional entities in the file. The optional argument \texttt{format} can be used to force the format of the file (currently "brep", "step" or "iges").
Input: \texttt{fileName} (string), \texttt{highestDimOnly = True} (boolean), \texttt{format = ""} (string)
Output: \texttt{outDimTags} (vector of pairs of integers)
Return: -
Language-specific definition:
\texttt{C++}, C, Python, Julia
Examples: C++ (t20.cpp), Python (t20.py)

gmsh/model/occ/importShapesNativePointer
Imports an OpenCASCADE shape by providing a pointer to a native OpenCASCADE \texttt{TopoDS\_Shape} object (passed as a pointer to void). The imported entities are returned in \texttt{outDimTags} as a vector of (dim, tag) pairs. If the optional argument \texttt{highestDimOnly} is set, only import the highest dimensional entities in \texttt{shape}. In Python, this function can be used for integration with PythonOCC, in which the \texttt{SwigPyObject} pointer of \texttt{TopoDS\_Shape} must be passed as an int to \texttt{shape}, i.e., \texttt{shape = int(pytonocc\_shape\.this)}. Warning: this function is unsafe, as providing an invalid pointer will lead to undefined behavior.
Input: \texttt{shape} (pointer), \texttt{highestDimOnly = True} (boolean)
Output: \texttt{outDimTags} (vector of pairs of integers)
Return: -
Language-specific definition:
\texttt{C++}, C, Python, Julia

gmsh/model/occ/getEntities
Get all the OpenCASCADE entities. If \texttt{dim} is \texttt{>= 0}, return only the entities of the specified dimension (e.g. points if \texttt{dim == 0}). The entities are returned as a vector of (dim, tag) pairs.
Input: \texttt{dim = -1} (integer)
Output: \texttt{dimTags} (vector of pairs of integers)
Return: -
Language-specific definition:

C++, C, Python, Julia

Examples: C++ (t20.cpp), Python (t20.py, bsplineBezier_patches.py, naca_boundary_layer_3d.py, tube_boundary_layer.py)

gmsh/model/occ/getEntitiesInBoundingBox
Get the OpenCASCADE entities in the bounding box defined by the two points (xmin, ymin, zmin) and (xmax, ymax, zmax). If dim is >= 0, return only the entities of the specified dimension (e.g. points if dim == 0).
Input: xmin (double), ymin (double), zmin (double), xmax (double), ymax (double), zmax (double), dim = -1 (integer)
Output: dimTags (vector of pairs of integers)
Return: -

Language-specific definition:

C++, C, Python, Julia

gmsh/model/occ/getBoundingBox
Get the bounding box (xmin, ymin, zmin), (xmax, ymax, zmax) of the OpenCASCADE entity of dimension dim and tag tag.
Input: dim (integer), tag (integer)
Output: xmin (double), ymin (double), zmin (double), xmax (double), ymax (double), zmax (double)
Return: -

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (t20.cpp), Python (t20.py, naca_boundary_layer_3d.py)

gmsh/model/occ/getCurveLoops
Get the tags curveLoopTags of the curve loops making up the surface of tag surfaceTag, as well as the tags curveTags of the curves making up each curve loop.
Input: surfaceTag (integer)
Output: curveLoopTags (vector of integers), curveTags (vector of vectors of integers)
Return: -

Language-specific definition:

C++, C, Python, Julia

gmsh/model/occ/getSurfaceLoops
Get the tags surfaceLoopTags of the surface loops making up the volume of tag volumeTag, as well as the tags surfaceTags of the surfaces making up each surface loop.
Input: volumeTag (integer)
Output: surfaceLoopTags (vector of integers), surfaceTags (vector of vectors of integers)
Return: -
Language-specific definition:
   C++, C, Python, Julia

**gmsh/model/occ/getMass**
Get the mass of the OpenCASCADE entity of dimension dim and tag tag.
Input:    dim (integer), tag (integer)
Output:   mass (double)
Return:   -
Language-specific definition:
   C++, C, Python, Julia
Examples: Python (step_assembly.py, volume.py)

**gmsh/model/occ/getCenterOfMass**
Get the center of mass of the OpenCASCADE entity of dimension dim and tag tag.
Input:    dim (integer), tag (integer)
Output:   x (double), y (double), z (double)
Return:   -
Language-specific definition:
   C++, C, Python, Julia

**gmsh/model/occ/getMatrixOfInertia**
Get the matrix of inertia (by row) of the OpenCASCADE entity of dimension dim and tag tag.
Input:    dim (integer), tag (integer)
Output:   mat (vector of doubles)
Return:   -
Language-specific definition:
   C++, C, Python, Julia

**gmsh/model/occ/getMaxTag**
Get the maximum tag of entities of dimension dim in the OpenCASCADE CAD representation.
Input:    dim (integer)
Output:   -
Return:   integer
Language-specific definition:
   C++, C, Python, Julia

**gmsh/model/occ/setMaxTag**
Set the maximum tag maxTag for entities of dimension dim in the OpenCASCADE CAD representation.
Input:    dim (integer), maxTag (integer)
Output:   -
Return:   -
Language-specific definition:
   C++, C, Python, Julia
Synchronize the OpenCASCADE CAD representation with the current Gmsh model. This can be called at any time, but since it involves a non-trivial amount of processing, the number of synchronization points should normally be minimized. Without synchronization the entities in the OpenCASCADE CAD representation are not available to any function outside of the OpenCASCADE CAD kernel functions.

Input: -
Output: -
Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t16.cpp, t17.cpp, t18.cpp, t19.cpp, t20.cpp, ...), Python (t16.py, t17.py, t18.py, t19.py, t20.py, ...)

6.9 Namespace gmsh/model/occ/mesh: OpenCASCADE CAD kernel meshing constraints

Set a mesh size constraint on the entities dimTags (given as a vector of (dim, tag) pairs) in the OpenCASCADE CAD representation. Currently only entities of dimension 0 (points) are handled.

Input: dimTags (vector of pairs of integers), size (double)
Output: -
Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (naca_boundary_layer_3d.py)

6.10 Namespace gmsh/view: post-processing view functions

Add a new post-processing view, with name name. If tag is positive use it (and remove the view with that tag if it already exists), otherwise associate a new tag. Return the view tag.

Input: name (string), tag = -1 (integer)
Output: -
Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t4.cpp, x3.cpp, x4.cpp, x5.cpp), Python (t4.py, x3.py, x4.py, x5.py, adapt_mesh.py, ...)

Remove the view with tag tag.

Input: tag (integer)
Output: -
Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (plugin.py)

**gmsh/view/getIndex**
Get the index of the view with tag `tag` in the list of currently loaded views. This dynamic index (it can change when views are removed) is used to access view options.

Input: `tag` (integer)
Output: -
Return: integer

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (adapt_mesh.py)

**gmsh/view/getTags**
Get the tags of all views.

Input: -
Output: `tags` (vector of integers)
Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: C++ (t8.cpp, t9.cpp), Python (t8.py, t9.py, plugin.py)

**gmsh/view/addModelData**
Add model-based post-processing data to the view with tag `tag`. `modelName` identifies the model the data is attached to. `dataType` specifies the type of data, currently either "NodeData", "ElementData" or "ElementNodeData". `step` specifies the identifier (>= 0) of the data in a sequence. `tags` gives the tags of the nodes or elements in the mesh to which the data is associated. `data` is a vector of the same length as `tags`: each entry is the vector of double precision numbers representing the data associated with the corresponding tag. The optional `time` argument associates a time value with the data. `numComponents` gives the number of data components (1 for scalar data, 3 for vector data, etc.) per entity; if negative, it is automatically inferred (when possible) from the input data. `partition` allows one to specify data in several sub-sets.

Input: `tag` (integer), `step` (integer), `modelName` (string), `dataType` (string), `tags` (vector of sizes), `data` (vector of vectors of doubles), `time = 0.` (double), `numComponents = -1` (integer), `partition = 0` (integer)
Output: -
Return: -

Language-specific definition:
- C++, C, Python, Julia

Examples: Python (adapt_mesh.py, plugin.py, poisson.py, view.py)
gmsh/view/addHomogeneousModelData
Add homogeneous model-based post-processing data to the view with tag \texttt{tag}. The arguments have the same meaning as in \texttt{addModelData}, except that \texttt{data} is supposed to be homogeneous and is thus flattened in a single vector. For data types that can lead to different data sizes per tag (like "ElementNodeData"), the data should be padded.

Input: \texttt{tag} (integer), \texttt{step} (integer), \texttt{modelName} (string), \texttt{dataType} (string), \texttt{tags} (vector of sizes), \texttt{data} (vector of doubles), \texttt{time} = 0. (double), \texttt{numComponents} = -1 (integer), \texttt{partition} = 0 (integer)

Output: -
Return: -

Language-specific definition: C++, C, Python, Julia

Examples: C++ (x4.cpp), Python (x4.py, copy_mesh.py, view_element_size.py, view_renumbering.py)

gmsh/view/getModelData
Get model-based post-processing data from the view with tag \texttt{tag} at step \texttt{step}. Return the \texttt{data} associated to the nodes or the elements with tags \texttt{tags}, as well as the \texttt{dataType} and the number of components \texttt{numComponents}.

Input: \texttt{tag} (integer), \texttt{step} (integer)

Output: \texttt{dataType} (string), \texttt{tags} (vector of sizes), \texttt{data} (vector of vectors of doubles), \texttt{time} (double), \texttt{numComponents} (integer)

Return: -

Language-specific definition: C++, C, Python, Julia

Examples: Python (get_data_perf.py, mesh_quality.py, plugin.py)

gmsh/view/getHomogeneousModelData
Get homogeneous model-based post-processing data from the view with tag \texttt{tag} at step \texttt{step}. The arguments have the same meaning as in \texttt{getModelData}, except that \texttt{data} is returned flattened in a single vector, with the appropriate padding if necessary.

Input: \texttt{tag} (integer), \texttt{step} (integer)

Output: \texttt{dataType} (string), \texttt{tags} (vector of sizes), \texttt{data} (vector of doubles), \texttt{time} (double), \texttt{numComponents} (integer)

Return: -

Language-specific definition: C++, C, Python, Julia

Examples: Python (get_data_perf.py)

gmsh/view/addListData
Add list-based post-processing data to the view with tag \texttt{tag}. List-based datasets are independent from any model and any mesh. \texttt{dataType} identifies the data by concatenating the field type ("S" for scalar, "V" for vector, "T" for tensor) and the element type ("P" for point, "L" for line, "T" for triangle, "S" for tetrahedron, "I" for prism, "H" for hexahedron, "Y" for pyramid). For example \texttt{dataType} should
be "ST" for a scalar field on triangles. numEle gives the number of elements in the data. data contains the data for the numEle elements, concatenated, with node coordinates followed by values per node, repeated for each step: [e1x1, ..., e1xn, e1y1, ..., elyn, e1z1, ..., elzn, e1v1..., e1vN, e2x1, ...].

Input:  tag (integer), dataType (string), numEle (integer), data (vector of doubles)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (x3.cpp, x5.cpp), Python (x3.py, x5.py, normals.py, view_adaptive_to_mesh.py, view_combine.py, ...)

gmsh/view/getListData
Get list-based post-processing data from the view with tag tag. Return the types dataType, the number of elements numElements for each data type and the data for each data type. If returnAdaptive is set, return the data obtained after adaptive refinement, if available.

Input:  tag (integer), returnAdaptive = False (boolean)

Output:  dataType (vector of strings), numElements (vector of integers), data (vector of vectors of doubles)

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: Python (plugin.py, view_adaptive_to_mesh.py, volume.py)

gmsh/view/addListDataString
Add a string to a list-based post-processing view with tag tag. If coord contains 3 coordinates the string is positioned in the 3D model space ("3D string"); if it contains 2 coordinates it is positioned in the 2D graphics viewport ("2D string"). data contains one or more (for multistep views) strings. style contains key-value pairs of styling parameters, concatenated. Available keys are "Font" (possible values: "Times-Roman", "Times-Bold", "Times-Italic", "Times-BoldItalic", "Helvetica", "Helvetica-Bold", "Helvetica-Oblique", "Helvetica-BoldOblique", "Courier", "Courier-Bold", "Courier-Oblique", "Courier-BoldOblique", "Symbol", "ZapfDingbats", "Screen"), "FontSize" and "Align" (possible values: "Left" or "BottomLeft", "Center" or "BottomCenter", "Right" or "BottomRight", "TopLeft", "TopCenter", "TopRight", "CenterLeft", "CenterCenter", "CenterRight").

Input:  tag (integer), coord (vector of doubles), data (vector of strings), style = [] (vector of strings)

Output: -

Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t4.cpp, x3.cpp), Python (t4.py, x3.py)
gmsh/view/getListDataStrings
Get list-based post-processing data strings (2D strings if \( \text{dim} = 2 \), 3D strings if \( \text{dim} = 3 \)) from the view with tag \( \text{tag} \). Return the coordinates in \( \text{coord} \), the strings in \( \text{data} \) and the styles in \( \text{style} \).

Input: \( \text{tag} \) (integer), \( \text{dim} \) (integer)
Output: \( \text{coord} \) (vector of doubles), \( \text{data} \) (vector of strings), \( \text{style} \) (vector of strings)
Return: -
Language-specific definition:
\( \text{C++}, \text{C}, \text{Python}, \text{Julia} \)

gmsh/view/setInterpolationMatrices
Set interpolation matrices for the element family \( \text{type} \) ("Line", "Triangle", "Quadrangle", "Tetrahedron", "Hexahedron", "Prism", "Pyramid") in the view \( \text{tag} \). The approximation of the values over an element is written as a linear combination of \( d \) basis functions \( f_i(u, v, w) = \sum_{(j = 0, \ldots, d - 1)} \text{coef}[i][j] u^{\text{exp}[j][0]} v^{\text{exp}[j][1]} w^{\text{exp}[j][2]} \), \( i = 0, \ldots, d-1 \), with \( u, v, w \) the coordinates in the reference element. The \( \text{coef} \) matrix (of size \( d \times d \)) and the \( \text{exp} \) matrix (of size \( d \times 3 \)) are stored as vectors, by row. If \( dGeo \) is positive, use \( \text{coefGeo} \) and \( \text{expGeo} \) to define the interpolation of the \( x, y, z \) coordinates of the element in terms of the \( u, v, w \) coordinates, in exactly the same way. If \( d < 0 \), remove the interpolation matrices.

Input: \( \text{tag} \) (integer), \( \text{type} \) (string), \( d \) (integer), \( \text{coef} \) (vector of doubles), \( \text{exp} \) (vector of doubles), \( dGeo = 0 \) (integer), \( \text{coefGeo} = [] \) (vector of doubles), \( \text{expGeo} = [] \) (vector of doubles)
Output: -
Return: -
Language-specific definition:
\( \text{C++}, \text{C}, \text{Python}, \text{Julia} \)
Examples: C++ (x3.cpp), Python (x3.py, view_adaptive_to_mesh.py)

gmsh/view/addAlias
Add a post-processing view as an alias of the reference view with tag \( \text{refTag} \). If \( \text{copyOptions} \) is set, copy the options of the reference view. If \( \text{tag} \) is positive use it (and remove the view with that tag if it already exists), otherwise associate a new tag. Return the view tag.

Input: \( \text{refTag} \) (integer), \( \text{copyOptions} = \text{False} \) (boolean), \( \text{tag} = -1 \) (integer)
Output: -
Return: integer
Language-specific definition:
\( \text{C++}, \text{C}, \text{Python}, \text{Julia} \)
Examples: Python (view_combine.py)

gmsh/view/combine
Combine elements (if \( \text{what} == \text{"elements"} \)) or steps (if \( \text{what} == \text{"steps"} \)) of all views (\( \text{how} == \text{"all"} \)), all visible views (\( \text{how} == \text{"visible"} \)) or all views having the same name (\( \text{how} == \text{"name"} \)). Remove original views if \( \text{remove} \) is set.

Input: \( \text{what} \) (string), \( \text{how} \) (string), \( \text{remove} = \text{True} \) (boolean), \( \text{copyOptions} = \text{True} \) (boolean)
gmsh/view/probe
Probe the view tag for its values at point (x, y, z). If no match is found, value is returned empty. Return only the value at step step is step is positive. Return only values with numComp if numComp is positive. Return the gradient of the values if gradient is set. If distanceMax is zero, only return a result if an exact match inside an element in the view is found; if distanceMax is positive and an exact match is not found, return the value at the closest node if it is closer than distanceMax; if distanceMax is negative and an exact match is not found, always return the value at the closest node. The distance to the match is returned in distance. Return the result from the element described by its coordinates if xElementCoord, yElementCoord and zElementCoord are provided. If dim is >= 0, return only matches from elements of the specified dimension.

Input: tag (integer), x (double), y (double), z (double), step = -1 (integer), numComp = -1 (integer), gradient = False (boolean), distanceMax = 0. (double), xElemCoord = [] (vector of doubles), yElemCoord = [] (vector of doubles), zElemCoord = [] (vector of doubles), dim = -1 (integer)

Output: values (vector of doubles), distance (double)

gmsh/view/write
Write the view to a file fileName. The export format is determined by the file extension. Append to the file if append is set.

Input: tag (integer), fileName (string), append = False (boolean)

Output: -
Return: -

gmsh/view/setVisibilityPerWindow
Set the global visibility of the view tag per window to value, where windowIndex identifies the window in the window list.

Input: tag (integer), value (integer), windowIndex = 0 (integer)

Output: -
Return: -
6.11 Namespace gmsh/view/option: view option handling functions

gmsh/view/option/setNumber
Set the numerical option name to value value for the view with tag tag.
Input:  tag (integer), name (string), value (double)
Output: -
Return: -
Language-specific definition:
        C++, C, Python, Julia
Examples: C++ (t8.cpp, t9.cpp, x3.cpp, x5.cpp), Python (t8.py, t9.py, x3.py, x5.py, view_adaptive_to_mesh.py)

gmsh/view/option/getNumber
Get the value of the numerical option name for the view with tag tag.
Input:  tag (integer), name (string)
Output: value (double)
Return: -
Language-specific definition:
        C++, C, Python, Julia
Examples: C++ (t8.cpp, x3.cpp), Python (t8.py, x3.py)

gmsh/view/option/setString
Set the string option name to value value for the view with tag tag.
Input:  tag (integer), name (string), value (string)
Output: -
Return: -
Language-specific definition:
        C++, C, Python, Julia
Examples: C++ (t4.cpp, t8.cpp), Python (t4.py, t8.py)

gmsh/view/option(getString)
Get the value of the string option name for the view with tag tag.
Input:  tag (integer), name (string)
Output: value (string)
Return: -
Language-specific definition:
        C++, C, Python, Julia

gmsh/view/option/setColor
Set the color option name to the RGBA value (r, g, b, a) for the view with tag tag, where where r, g, b and a should be integers between 0 and 255.
Input:  tag (integer), name (string), r (integer), g (integer), b (integer), a = 255 (integer)
Output: -
Return: -
Language-specific definition:

C++, C, Python, Julia

gmsh/view/option/getColor
Get the r, g, b, a value of the color option name for the view with tag tag.
Input:  tag (integer), name (string)
Output:  r (integer), g (integer), b (integer), a (integer)
Return:  -

Language-specific definition:

C++, C, Python, Julia

gmsh/view/option/copy
Copy the options from the view with tag refTag to the view with tag tag.
Input:  refTag (integer), tag (integer)
Output:  -
Return:  -

Language-specific definition:

C++, C, Python, Julia

6.12 Namespace gmsh/plugin: plugin functions

gmsh/plugin/setNumber
Set the numerical option option to the value value for plugin name. Plugins available in the official Gmsh release are listed in the "Gmsh plugins" chapter of the Gmsh reference manual.
Input:  name (string), option (string), value (double)
Output:  -
Return:  -

Language-specific definition:

C++, C, Python, Julia

Examples: C++ (t9.cpp, t21.cpp), Python (t9.py, t21.py, adapt_mesh.py, crack3d.py, crack.py, ...)

gmsh/plugin/setString
Set the string option option to the value value for plugin name. Plugins available in the official Gmsh release are listed in the "Gmsh plugins" chapter of the Gmsh reference manual.
Input:  name (string), option (string), value (string)
Output:  -
Return:  -

Language-specific definition:

C++, C, Python, Julia

Examples:  C++ (t9.cpp), Python (t9.py)

gmsh/plugin/run
Run the plugin name. Return the tag of the created view (if any). Plugins available in the official Gmsh release are listed in the "Gmsh plugins" chapter of the Gmsh reference manual.
Input:   name (string)
Output:  -
Return:  integer

Language-specific definition:
   C++, C, Python, Julia

Examples: C++ (t9.cpp, t21.cpp), Python (t9.py, t21.py, adapt_mesh.py, crack3d.py, crack.py, ...)

6.13 Namespace gmsh/graphics: graphics functions

`gmsh/graphics/draw`
Draw all the OpenGL scenes.

Input:  -
Output: -
Return: -

Language-specific definition:
   C++, C, Python, Julia

Examples: C++ (t3.cpp, t8.cpp, t13.cpp, t21.cpp), Python (t3.py, t8.py, t13.py, t21.py, split_window.py)

6.14 Namespace gmsh/fltk: FLTK graphical user interface functions

`gmsh/fltk/initialize`
Create the FLTK graphical user interface. Can only be called in the main thread.

Input:  -
Output: -
Return: -

Language-specific definition:
   C++, C, Python, Julia

Examples: C++ (t3.cpp, t8.cpp, t13.cpp, t21.cpp), Python (t3.py, t8.py, t13.py, t21.py, custom_gui.py, ...)

`gmsh/fltk/finalize`
Close the FLTK graphical user interface. Can only be called in the main thread.

Input:  -
Output: -
Return: -

Language-specific definition:
   C++, C, Python, Julia

`gmsh/fltk/wait`
Wait at most time seconds for user interface events and return. If time < 0, wait indefinitely. First automatically create the user interface if it has not yet been initialized. Can only be called in the main thread.
Input: \( \text{time} = -1. \) (double)

Output: -

Return: -

Language-specific definition:

- C++
- C
- Python
- Julia

Examples: C++ (t3.cpp, t13.cpp, t21.cpp), Python (t3.py, t13.py, t21.py, custom_gui.py, prepro.py, ...)

**gmsh/fltk/update**

Update the user interface (potentially creating new widgets and windows). First automatically create the user interface if it has not yet been initialized. Can only be called in the main thread: use `awake("update")` to trigger an update of the user interface from another thread.

Input: -

Output: -

Return: -

Language-specific definition:

- C++
- C
- Python
- Julia

Examples: Python (custom_gui.py, prepro.py)

**gmsh/fltk/awake**

Awake the main user interface thread and process pending events, and optionally perform an action (currently the only action allowed is "update").

Input: \( \text{action} = "" \) (string)

Output: -

Return: -

Language-specific definition:

- C++
- C
- Python
- Julia

Examples: Python (custom_gui.py)

**gmsh/fltk/lock**

Block the current thread until it can safely modify the user interface.

Input: -

Output: -

Return: -

Language-specific definition:

- C++
- C
- Python
- Julia

Examples: Python (custom_gui.py)

**gmsh/fltk/unlock**

Release the lock that was set using lock.

Input: -

Output: -

Return: -
Language-specific definition:
  C++, C, Python, Julia

Examples: Python (custom_gui.py)

`gmsh/fltk/run`
Run the event loop of the graphical user interface, i.e. repeatedly call `wait()`. First automatically create the user interface if it has not yet been initialized. Can only be called in the main thread.

Input: -
Output: -
Return: -

Language-specific definition:
  C++, C, Python, Julia

Examples: C++ (t1.cpp, t2.cpp, t4.cpp, t5.cpp, t6.cpp, ...), Python (t1.py, t2.py, t4.py, t5.py, t6.py, ...)

`gmsh/fltk/isAvailable`
Check if the user interface is available (e.g. to detect if it has been closed).

Input: -
Output: -
Return: integer

Language-specific definition:
  C++, C, Python, Julia

Examples: C++ (t3.cpp, t13.cpp, t21.cpp), Python (t3.py, t13.py, t21.py, custom_gui.py, prepro.py, ...)

`gmsh/fltk/selectEntities`
Select entities in the user interface. Return the selected entities as a vector of (dim, tag) pairs. If `dim` is >= 0, return only the entities of the specified dimension (e.g. points if `dim` == 0).

Input: `dim = -1` (integer)
Output: `dimTags` (vector of pairs of integers)
Return: integer

Language-specific definition:
  C++, C, Python, Julia

Examples: Python (prepro.py)

`gmsh/fltk/selectElements`
Select elements in the user interface.

Input: -
Output: `elementTags` (vector of sizes)
Return: integer

Language-specific definition:
  C++, C, Python, Julia

Examples: Python (select_elements.py)
gmsh/fltk/selectViews
Select views in the user interface.
Input: -
Output: viewTags (vector of integers)
Return: integer
Language-specific definition:
- C++, C, Python, Julia

gmsh/fltk/splitCurrentWindow
Split the current window horizontally (if how == "h") or vertically (if how == "v"), using ratio ratio. If how == "u", restore a single window.
Input: how = "v" (string), ratio = 0.5 (double)
Output: -
Return: -
Language-specific definition:
- C++, C, Python, Julia
Examples: Python (split_window.py)

gmsh/fltk/setCurrentWindow
Set the current window by specifying its index (starting at 0) in the list of all windows. When new windows are created by splits, new windows are appended at the end of the list.
Input: windowIndex = 0 (integer)
Output: -
Return: -
Language-specific definition:
- C++, C, Python, Julia
Examples: Python (split_window.py)

gmsh/fltk/setStatusMessage
Set a status message in the current window. If graphics is set, display the message inside the graphic window instead of the status bar.
Input: message (string), graphics = False (boolean)
Output: -
Return: -
Language-specific definition:
- C++, C, Python, Julia
Examples: Python (prepro.py, select_elements.py)

gmsh/fltk/showContextWindow
Show context window for the entity of dimension dim and tag tag.
Input: dim (integer), tag (integer)
Output: -
Return: -
Language-specific definition:
  C++, C, Python, Julia
Examples:  Python (prepro.py)

\texttt{gmsh/fltk/openTreeItem}
  Open the \texttt{name} item in the menu tree.
  Input:  \texttt{name} (string)
  Output:  -
  Return:  -

Language-specific definition:
  C++, C, Python, Julia
Examples:  Python (prepro.py)

\texttt{gmsh/fltk/closeTreeItem}
  Close the \texttt{name} item in the menu tree.
  Input:  \texttt{name} (string)
  Output:  -
  Return:  -

Language-specific definition:
  C++, C, Python, Julia

6.15 Namespace \texttt{gmsh/parser}: parser functions

\texttt{gmsh/parser/getNames}
  Get the names of the variables in the Gmsh parser matching the \texttt{search} regular expression. If \texttt{search} is empty, return all the names.
  Input:  \texttt{search = ""} (string)
  Output:  \texttt{names} (vector of strings)
  Return:  -

Language-specific definition:
  C++, C, Python, Julia

\texttt{gmsh/parser/setNumber}
  Set the value of the number variable \texttt{name} in the Gmsh parser. Create the variable if it does not exist; update the value if the variable exists.
  Input:  \texttt{name} (string), \texttt{value} (vector of doubles)
  Output:  -
  Return:  -

Language-specific definition:
  C++, C, Python, Julia

\texttt{gmsh/parser/setString}
  Set the value of the string variable \texttt{name} in the Gmsh parser. Create the variable if it does not exist; update the value if the variable exists.
  Input:  \texttt{name} (string), \texttt{value} (vector of strings)
  Output:  -
Return: -

Language-specific definition: 
   C++, C, Python, Julia

**gmsh/parser/getNumber**
Get the value of the number variable `name` from the Gmsh parser. Return an empty vector if the variable does not exist.

Input: `name` (string)
Output: `value` (vector of doubles)
Return: -

Language-specific definition: 
   C++, C, Python, Julia

**gmsh/parser(getString)**
Get the value of the string variable `name` from the Gmsh parser. Return an empty vector if the variable does not exist.

Input: `name` (string)
Output: `value` (vector of strings)
Return: -

Language-specific definition: 
   C++, C, Python, Julia

**gmsh/parser/clear**
Clear all the Gmsh parser variables, or remove a single variable if `name` is given.

Input: `name = ""` (string)
Output: -
Return: -

Language-specific definition: 
   C++, C, Python, Julia

**gmsh/parser/parse**
Parse the file `fileName` with the Gmsh parser.

Input: `fileName` (string)
Output: -
Return: -

Language-specific definition: 
   C++, C, Python, Julia

6.16 Namespace gmsh/onelab: ONELAB server functions

**gmsh/onelab/set**
Set one or more parameters in the ONELAB database, encoded in `format`.

Input: `data` (string), `format = "json"` (string)
Output: -
Return: -
Language-specific definition:

- C++, C, Python, Julia

Examples: C++ (t3.cpp, t13.cpp, t21.cpp), Python (t3.py, t13.py, t21.py, custom_gui.py, onelab_test.py, ...)

**gmsh/onelab/get**

Get all the parameters (or a single one if name is specified) from the ONELAB database, encoded in format.

Input: name = "" (string), format = "json" (string)

Output: data (string)

Return: -

**gmsh/onelab/getNames**

Get the names of the parameters in the ONELAB database matching the search regular expression. If search is empty, return all the names.

Input: search = "" (string)

Output: names (vector of strings)

Return: -

**gmsh/onelab/setNumber**

Set the value of the number parameter name in the ONELAB database. Create the parameter if it does not exist; update the value if the parameter exists.

Input: name (string), value (vector of doubles)

Output: -

Return: -

**gmsh/onelab/setString**

Set the value of the string parameter name in the ONELAB database. Create the parameter if it does not exist; update the value if the parameter exists.

Input: name (string), value (vector of strings)

Output: -

Return: -
gmsh/onelab/getNumber
Get the value of the number parameter name from the ONELAB database. Return an empty vector if the parameter does not exist.

Input: name (string)
Output: value (vector of doubles)
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t3.cpp, t13.cpp, t21.cpp), Python (t3.py, t13.py, t21.py, custom_gui.py, prepro.py, ...)

gmsh/onelab(getString
Get the value of the string parameter name from the ONELAB database. Return an empty vector if the parameter does not exist.

Input: name (string)
Output: value (vector of strings)
Return: -

Language-specific definition:
C++, C, Python, Julia

Examples: C++ (t3.cpp, t13.cpp, t21.cpp), Python (t3.py, t13.py, t21.py, custom_gui.py, prepro.py, ...)

gmsh/onelab/getChanged
Check if any parameters in the ONELAB database used by the client name have been changed.

Input: name (string)
Output: -
Return: integer

Language-specific definition:
C++, C, Python, Julia

gmsh/onelab/setChanged
Set the changed flag to value value for all the parameters in the ONELAB database used by the client name.

Input: name (string), value (integer)
Output: -
Return: -

Language-specific definition:
C++, C, Python, Julia

gmsh/onelab/clear
Clear the ONELAB database, or remove a single parameter if name is given.

Input: name = "" (string)
Output: -
Return: -
Language-specific definition:
   C++, C, Python, Julia
Examples: Python (onelab_test.py)

**gmsh/onelab/run**
Run a ONELAB client. If name is provided, create a new ONELAB client with name name and executes command. If not, try to run a client that might be linked to the processed input files.

Input:    name = "" (string), command = "" (string)
Output:   -
Return:   -

Language-specific definition:
   C++, C, Python, Julia
Examples: Python (onelab_run.py, onelab_run_auto.py)

### 6.17 Namespace gmsh/logger: information logging functions

**gmsh/logger/write**
Write a message. level can be "info", "warning" or "error".

Input:    message (string), level = "info" (string)
Output:   -
Return:   -

Language-specific definition:
   C++, C, Python, Julia
Examples: C++ (t7.cpp, t8.cpp, t9.cpp, t13.cpp, t16.cpp, ...), Python (t8.py, t9.py, x5.py, custom_gui.py, terrain_stl.py)

**gmsh/logger/start**
Start logging messages.

Input:    -
Output:   -
Return:   -

Language-specific definition:
   C++, C, Python, Julia
Examples: C++ (t16.cpp), Python (t16.py)

**gmsh/logger/get**
Get logged messages.

Input:    -
Output:   log (vector of strings)
Return:   -

Language-specific definition:
   C++, C, Python, Julia
Examples: C++ (t16.cpp), Python (t16.py)
**gmsh/logger/stop**

Stop logging messages.

Input: -

Output: -

Return: -

Language-specific definition:

- C++, C, Python, Julia

Examples: C++ (t16.cpp), Python (t16.py)

**gmsh/logger/getWallTime**

Return wall clock time.

Input: -

Output: -

Return: double

Language-specific definition:

- C++, C, Python, Julia

Examples: Python (import_perf.py)

**gmsh/logger/getCpuTime**

Return CPU time.

Input: -

Output: -

Return: double

Language-specific definition:

- C++, C, Python, Julia

**gmsh/logger/getLastError**

Return last error message, if any.

Input: -

Output: **error** (string)

Return: -

Language-specific definition:

- C++, C, Python, Julia
Chapter 7: Gmsh options

This chapter lists all the Gmsh options. Options can be specified in script files (see Section 5.1 [General scripting commands], page 91) or using the API (see Section 6.2 [Namespace gmsh/option], page 128): see Section 2.3 [t3], page 21 for an example. They can also be specified on the command line using the -setnumber and -setstring switches: see Chapter 4 [Gmsh command-line interface], page 85. Many options can also be changed interactively in the GUI (see Chapter 3 [Gmsh graphical user interface], page 79): to see which option corresponds to which widget in the GUI, leave your mouse on the widget and a tooltip with the option name will appear. Note that some options can affect the GUI in real time: loading a script file that sets General.GraphicsWidth for example (see Section 7.1 [General options], page 223) will change the width of the graphic window at runtime.

Gmsh’s default behavior is to save some of these options in a per-user “session resource” file (cf. “Saved in: General.SessionFileName” in the option descriptions below) every time Gmsh is shut down. This permits for example to automatically remember the size and location of the windows or which fonts to use. A second set of options can be saved (automatically or manually with the ‘File->Save Options As Default’ menu) in a per-user “option” file (cf. “Saved in: General.OptionsFileName” in the descriptions below), automatically loaded by Gmsh every time it starts up. Finally, other options are only saved to disk manually, either by explicitly saving an option file with ‘File->Export’, or when saving per-model options with ‘File->Save Model Options’ (cf. “Saved in: ~” in the lists below). Per-model options are saved in a file name matching the model file, but with an extra ‘.opt’ extension appended: the option file will be automatically opened after Gmsh opens the model file.

Gmsh will attempt to save and load the session and option files first in the $GMSH_HOME directory, then in $APPDATA (on Windows) or $HOME (on other OSes), then in $TMP, and finally in $TEMP, in that order. If none of these variables are defined, Gmsh will try to save and load the files from the current working directory.

To reset all options to their default values, either delete the General.SessionFileName and General.OptionsFileName files by hand, use ‘Help->Restore All Options to Default Settings’, or click on ‘Restore all options to default settings’ button in the ‘Tools->Options->General->Advanced’ window.

7.1 General options

General.AxesFormatX
   Number format for X-axis (in standard C form)
   Default value: "%.3g"
   Saved in: General.OptionsFileName

General.AxesFormatY
   Number format for Y-axis (in standard C form)
   Default value: "%.3g"
   Saved in: General.OptionsFileName

General.AxesFormatZ
   Number format for Z-axis (in standard C form)
   Default value: "%.3g"
   Saved in: General.OptionsFileName

General.AxesLabelX
   X-axis label
   Default value: ""
   Saved in: General.OptionsFileName
General.AxesLabelY
Y-axis label
Default value: ""
Saved in: General.OptionsFileName

General.AxesLabelZ
Z-axis label
Default value: ""
Saved in: General.OptionsFileName

General.BackgroundImageFileName
Background image file in JPEG, PNG or PDF format
Default value: ""
Saved in: General.OptionsFileName

General.BuildInfo
Gmsh build information (read-only)
Default value:
Saved in: -

General.BuildOptions
Gmsh build options (read-only)
Saved in: -

General.DefaultFileName
Default project file name
Default value: "untitled.geo"
Saved in: General.OptionsFileName

General.Display
X server to use (only for Unix versions)
Default value: ""
Saved in: -

General>ErrorFileName
File into which the log is saved if a fatal error occurs
Default value: ".gmsh-errors"
Saved in: General.OptionsFileName
General.ExecutableFileName
File name of the Gmsh executable (read-only)
Default value: ""
Saved in: General.SessionFileName

General.FileName
Current project file name (read-only)
Default value: ""
Saved in: -

General.FltkTheme
FLTK user interface theme (try e.g. plastic or gtk+)
Default value: ""
Saved in: General.SessionFileName

General.GraphicsFont
Font used in the graphic window
Default value: "Helvetica"
Saved in: General.OptionsFileName

General.GraphicsFontEngine
Set graphics font engine (Native, StringTexture, Cairo)
Default value: "Native"
Saved in: General.OptionsFileName

General.GraphicsFontTitle
Font used in the graphic window for titles
Default value: "Helvetica"
Saved in: General.OptionsFileName

General.OptionsFileName
Option file created with ‘Tools->Options->Save’; automatically read on startup
Default value: ".gmsh-options"
Saved in: General.SessionFileName

General.RecentFile0
Most recent opened file
Default value: "untitled.geo"
Saved in: General.SessionFileName

General.RecentFile1
2nd most recent opened file
Default value: "untitled.geo"
Saved in: General.SessionFileName

General.RecentFile2
3rd most recent opened file
Default value: "untitled.geo"
Saved in: General.SessionFileName

General.RecentFile3
4th most recent opened file
Default value: "untitled.geo"
Saved in: General.SessionFileName

General.RecentFile4
5th most recent opened file
Default value: "untitled.geo"
Saved in: General.SessionFileName
**General.RecentFile5**
- 6th most recent opened file
- Default value: "untitled.geo"
- Saved in: General.SessionFileName

**General.RecentFile6**
- 7th most recent opened file
- Default value: "untitled.geo"
- Saved in: General.SessionFileName

**General.RecentFile7**
- 8th most recent opened file
- Default value: "untitled.geo"
- Saved in: General.SessionFileName

**General.RecentFile8**
- 9th most recent opened file
- Default value: "untitled.geo"
- Saved in: General.SessionFileName

**General.RecentFile9**
- 10th most recent opened file
- Default value: "untitled.geo"
- Saved in: General.SessionFileName

**General.SessionFileName**
- Option file into which session specific information is saved; automatically read on startup
- Default value: ".gmshrc"
- Saved in: 

**General.ScriptingLanguages**
- Language(s) in which scripting commands generated by the GUI are written
- Default value: "geo"
- Saved in: General.OptionsFileName

**General.TextEditor**
- System command to launch a text editor
- Default value: "open -t '%s'"
- Saved in: General.OptionsFileName

**General.TmpFileName**
- Temporary file used by the geometry module
- Default value: ".gmsh-tmp"
- Saved in: General.SessionFileName

**General.Version**
- Gmsh version (read-only)
- Default value: "4.12.0-git-72c1f329f"
- Saved in: 

**General.WatchFilePattern**
- Pattern of files to merge as they become available
- Default value: ""
- Saved in: 

**General.AbortOnError**
- Abort on error? (0: no, 1: abort meshing, 2: throw an exception unless in interactive mode, 3: throw an exception always, 4: exit)
Chapter 7: Gmsh options

Default value: 0
Saved in: General.OptionsFileName

General.AlphaBlending
Enable alpha blending (transparency) in post-processing views
Default value: 1
Saved in: General.OptionsFileName

General.Antialiasing
Use multisample antialiasing (will slow down rendering)
Default value: 0
Saved in: General.OptionsFileName

General.ArrowHeadRadius
Relative radius of arrow head
Default value: 0.12
Saved in: General.OptionsFileName

General.ArrowStemLength
Relative length of arrow stem
Default value: 0.56
Saved in: General.OptionsFileName

General.ArrowStemRadius
Relative radius of arrow stem
Default value: 0.02
Saved in: General.OptionsFileName

General.Axes
Axes (0: none, 1: simple axes, 2: box, 3: full grid, 4: open grid, 5: ruler)
Default value: 0
Saved in: General.OptionsFileName

General.AxesMikado
Mikado axes style
Default value: 0
Saved in: General.OptionsFileName

General.AxesAutoPosition
Position the axes automatically
Default value: 1
Saved in: General.OptionsFileName

General.AxesForceValue
Force values on axes (otherwise use natural coordinates)
Default value: 0
Saved in: General.OptionsFileName

General.AxesMaxX
Maximum X-axis coordinate
Default value: 1
Saved in: General.OptionsFileName

General.AxesMaxY
Maximum Y-axis coordinate
Default value: 1
Saved in: General.OptionsFileName
General.AxesMaxZ
  Maximum Z-axis coordinate
  Default value: 1
  Saved in: General.OptionsFileName

General.AxesMinX
  Minimum X-axis coordinate
  Default value: 0
  Saved in: General.OptionsFileName

General.AxesMinY
  Minimum Y-axis coordinate
  Default value: 0
  Saved in: General.OptionsFileName

General.AxesMinZ
  Minimum Z-axis coordinate
  Default value: 0
  Saved in: General.OptionsFileName

General.AxesTicsX
  Number of tics on the X-axis
  Default value: 5
  Saved in: General.OptionsFileName

General.AxesTicsY
  Number of tics on the Y-axis
  Default value: 5
  Saved in: General.OptionsFileName

General.AxesTicsZ
  Number of tics on the Z-axis
  Default value: 5
  Saved in: General.OptionsFileName

General.AxesValueMaxX
  Maximum X-axis forced value
  Default value: 1
  Saved in: General.OptionsFileName

General.AxesValueMaxY
  Maximum Y-axis forced value
  Default value: 1
  Saved in: General.OptionsFileName

General.AxesValueMaxZ
  Maximum Z-axis forced value
  Default value: 1
  Saved in: General.OptionsFileName

General.AxesValueMinX
  Minimum X-axis forced value
  Default value: 0
  Saved in: General.OptionsFileName

General.AxesValueMinY
  Minimum Y-axis forced value
  Default value: 0
  Saved in: General.OptionsFileName
General.AxesValueMinZ
  Minimum Z-axis forced value
  Default value: 0
  Saved in: General.OptionsFileName

General.BackgroundGradient
  Draw background gradient (0: none, 1: vertical, 2: horizontal, 3: radial)
  Default value: 1
  Saved in: General.OptionsFileName

General.BackgroundImage3D
  Create background image in the 3D model (units = model units) or as 2D background (units = pixels)
  Default value: 0
  Saved in: General.OptionsFileName

General.BackgroundImagePage
  Page to render in the background image (for multi-page PDFs)
  Default value: 0
  Saved in: General.OptionsFileName

General.BackgroundImagePositionX
  X position of background image (for 2D background: < 0: measure from right window edge; >= 1e5: centered)
  Default value: 0
  Saved in: General.OptionsFileName

General.BackgroundImagePositionY
  Y position of background image (for 2D background: < 0: measure from bottom window edge; >= 1e5: centered)
  Default value: 0
  Saved in: General.OptionsFileName

General.BackgroundImageWidth
  Width of background image (0: actual width if height = 0, natural scaling if not; -1: graphic window width)
  Default value: -1
  Saved in: General.OptionsFileName

General.BackgroundImageHeight
  Height of background image (0: actual height if width = 0, natural scaling if not; -1: graphic window height)
  Default value: -1
  Saved in: General.OptionsFileName

General.BoundingBoxSize
  Overall bounding box size (read-only)
  Default value: 1
  Saved in: General.OptionsFileName

General.Camera
  Enable camera view mode
  Default value: 0
  Saved in: General.OptionsFileName
General.CameraAperture
   Camera aperture in degrees
   Default value: 40
   Saved in: General.OptionsFileName

General.CameraEyeSeparationRatio
   Eye separation ratio in % for stereo rendering
   Default value: 1.5
   Saved in: General.OptionsFileName

General.CameraFocalLengthRatio
   Camera Focal length ratio
   Default value: 1
   Saved in: General.OptionsFileName

General.Clip0A
   First coefficient in equation for clipping plane 0 ('A' in 'AX+BY+CZ+D=0')
   Default value: 1
   Saved in: -

General.Clip0B
   Second coefficient in equation for clipping plane 0 ('B' in 'AX+BY+CZ+D=0')
   Default value: 0
   Saved in: -

General.Clip0C
   Third coefficient in equation for clipping plane 0 ('C' in 'AX+BY+CZ+D=0')
   Default value: 0
   Saved in: -

General.Clip0D
   Fourth coefficient in equation for clipping plane 0 ('D' in 'AX+BY+CZ+D=0')
   Default value: 0
   Saved in: -

General.Clip1A
   First coefficient in equation for clipping plane 1
   Default value: 0
   Saved in: -

General.Clip1B
   Second coefficient in equation for clipping plane 1
   Default value: 1
   Saved in: -

General.Clip1C
   Third coefficient in equation for clipping plane 1
   Default value: 0
   Saved in: -

General.Clip1D
   Fourth coefficient in equation for clipping plane 1
   Default value: 0
   Saved in: -

General.Clip2A
   First coefficient in equation for clipping plane 2
   Default value: 0
   Saved in: -
General.Clip2B
  Second coefficient in equation for clipping plane 2
  Default value: 0
  Saved in: -

General.Clip2C
  Third coefficient in equation for clipping plane 2
  Default value: 1
  Saved in: -

General.Clip2D
  Fourth coefficient in equation for clipping plane 2
  Default value: 0
  Saved in: -

General.Clip3A
  First coefficient in equation for clipping plane 3
  Default value: -1
  Saved in: -

General.Clip3B
  Second coefficient in equation for clipping plane 3
  Default value: 0
  Saved in: -

General.Clip3C
  Third coefficient in equation for clipping plane 3
  Default value: 0
  Saved in: -

General.Clip3D
  Fourth coefficient in equation for clipping plane 3
  Default value: 1
  Saved in: -

General.Clip4A
  First coefficient in equation for clipping plane 4
  Default value: 0
  Saved in: -

General.Clip4B
  Second coefficient in equation for clipping plane 4
  Default value: -1
  Saved in: -

General.Clip4C
  Third coefficient in equation for clipping plane 4
  Default value: 0
  Saved in: -

General.Clip4D
  Fourth coefficient in equation for clipping plane 4
  Default value: 1
  Saved in: -

General.Clip5A
  First coefficient in equation for clipping plane 5
  Default value: 0
  Saved in: -
General.Clip5B
   Second coefficient in equation for clipping plane 5
   Default value: 0
   Saved in: -

General.Clip5C
   Third coefficient in equation for clipping plane 5
   Default value: -1
   Saved in: -

General.Clip5D
   Fourth coefficient in equation for clipping plane 5
   Default value: 1
   Saved in: -

General.ClipFactor
   Near and far clipping plane distance factor (decrease value for better z-buffer resolution)
   Default value: 5
   Saved in: -

General.ClipOnlyDrawIntersectingVolume
   Only draw layer of elements that intersect the clipping plane
   Default value: 0
   Saved in: General.OptionsFileName

General.ClipOnlyVolume
   Only clip volume elements
   Default value: 0
   Saved in: General.OptionsFileName

General.ClipPositionX
   Horizontal position (in pixels) of the upper left corner of the clipping planes window
   Default value: 650
   Saved in: General.SessionFileName

General.ClipPositionY
   Vertical position (in pixels) of the upper left corner of the clipping planes window
   Default value: 150
   Saved in: General.SessionFileName

General.ClipWholeElements
   Clip whole elements
   Default value: 0
   Saved in: General.OptionsFileName

General.ColorScheme
   Default color scheme for graphics (0: light, 1: default, 2: grayscale, 3: dark)
   Default value: 1
   Saved in: General.SessionFileName

General.ConfirmOverwrite
   Ask confirmation before overwriting files?
   Default value: 1
   Saved in: General.OptionsFileName
General.ContextPositionX
  Horizontal position (in pixels) of the upper left corner of the contextual windows
  Default value: 650
  Saved in: General.SessionFileName

General.ContextPositionY
  Vertical position (in pixels) of the upper left corner of the contextual windows
  Default value: 150
  Saved in: General.SessionFileName

General.DetachedMenu
  Should the menu window be detached from the graphic window?
  Default value: 0
  Saved in: General.SessionFileName

General.DetachedProcess
  On Windows, should processes created by Gmsh be detached?
  Default value: 1
  Saved in: General.OptionsFileName

General.DisplayBorderFactor
  Border factor for model display (0: model fits window size exactly)
  Default value: 0.2
  Saved in: General.OptionsFileName

General.DoubleBuffer
  Use a double buffered graphic window (on Unix, should be set to 0 when working on a remote host without GLX)
  Default value: 1
  Saved in: General.OptionsFileName

General.DrawBoundingBoxes
  Draw bounding boxes
  Default value: 0
  Saved in: General.OptionsFileName

General.ExpertMode
  Enable expert mode (to disable all the messages meant for inexperienced users)
  Default value: 0
  Saved in: General.OptionsFileName

General.ExtraPositionX
  Horizontal position (in pixels) of the upper left corner of the generic extra window
  Default value: 650
  Saved in: General.SessionFileName

General.ExtraPositionY
  Vertical position (in pixels) of the upper left corner of the generic extra window
  Default value: 350
  Saved in: General.SessionFileName

General.ExtraHeight
  Height (in pixels) of the generic extra window
  Default value: 100
  Saved in: General.SessionFileName
General.ExtraWidth
    Width (in pixels) of the generic extra window
    Default value: 100
    Saved in: General.SessionFileName

General.FastRedraw
    Draw simplified model while rotating, panning and zooming
    Default value: 0
    Saved in: General.OptionsFileName

General.FieldPositionX
    Horizontal position (in pixels) of the upper left corner of the field window
    Default value: 650
    Saved in: General.SessionFileName

General.FieldPositionY
    Vertical position (in pixels) of the upper left corner of the field window
    Default value: 550
    Saved in: General.SessionFileName

General.FieldHeight
    Height (in pixels) of the field window
    Default value: 320
    Saved in: General.SessionFileName

General.FieldWidth
    Width (in pixels) of the field window
    Default value: 420
    Saved in: General.SessionFileName

General.FileChooserPositionX
    Horizontal position (in pixels) of the upper left corner of the file chooser windows
    Default value: 200
    Saved in: General.SessionFileName

General.FileChooserPositionY
    Vertical position (in pixels) of the upper left corner of the file chooser windows
    Default value: 200
    Saved in: General.SessionFileName

General.FltkColorScheme
    FLTK user interface color theme (0: standard, 1:dark)
    Default value: 0
    Saved in: General.SessionFileName

General.FltkRefreshRate
    FLTK user interface maximum refresh rate, per second (0: no limit)
    Default value: 5
    Saved in: General.OptionsFileName

General.FontSize
    Size of the font in the user interface, in pixels (-1: automatic)
    Default value: -1
    Saved in: General.OptionsFileName

General.GraphicsFontSize
    Size of the font in the graphic window, in pixels
    Default value: 15
    Saved in: General.OptionsFileName
General.GraphicsFontSizeTitle
Size of the font in the graphic window for titles, in pixels
Default value: 18
Saved in: General.OptionsFileName

General.GraphicsHeight
Height (in pixels) of the graphic window
Default value: 600
Saved in: General.SessionFileName

General.GraphicsPositionX
Horizontal position (in pixels) of the upper left corner of the graphic window
Default value: 50
Saved in: General.SessionFileName

General.GraphicsPositionY
Vertical position (in pixels) of the upper left corner of the graphic window
Default value: 50
Saved in: General.SessionFileName

General.GraphicsWidth
Width (in pixels) of the graphic window
Default value: 800
Saved in: General.SessionFileName

General.HighOrderToolsPositionX
Horizontal position (in pixels) of the upper left corner of the high-order tools window
Default value: 650
Saved in: General.SessionFileName

General.HighOrderToolsPositionY
Vertical position (in pixels) of the upper left corner of the high-order tools window
Default value: 150
Saved in: General.SessionFileName

General.HighResolutionGraphics
Use high-resolution OpenGL graphics (e.g. for Macs with retina displays)
Default value: 1
Saved in: General.OptionsFileName

General.InitialModule
Module launched on startup (0: automatic, 1: geometry, 2: mesh, 3: solver, 4: post-processing)
Default value: 0
Saved in: General.OptionsFileName

General.InputScrolling
Enable numerical input scrolling in user interface (moving the mouse to change numbers)
Default value: 1
Saved in: General.OptionsFileName

General.Light0
Enable light source 0
Default value: 1
Saved in: General.OptionsFileName
General.Light0X
X position of light source 0
Default value: 0.65
Saved in: General.OptionsFileName

General.Light0Y
Y position of light source 0
Default value: 0.65
Saved in: General.OptionsFileName

General.Light0Z
Z position of light source 0
Default value: 1
Saved in: General.OptionsFileName

General.Light0W
Divisor of the X, Y and Z coordinates of light source 0 (W=0 means infinitely far source)
Default value: 0
Saved in: General.OptionsFileName

General.Light1
Enable light source 1
Default value: 0
Saved in: General.OptionsFileName

General.Light1X
X position of light source 1
Default value: 0.5
Saved in: General.OptionsFileName

General.Light1Y
Y position of light source 1
Default value: 0.3
Saved in: General.OptionsFileName

General.Light1Z
Z position of light source 1
Default value: 1
Saved in: General.OptionsFileName

General.Light1W
Divisor of the X, Y and Z coordinates of light source 1 (W=0 means infinitely far source)
Default value: 0
Saved in: General.OptionsFileName

General.Light2
Enable light source 2
Default value: 0
Saved in: General.OptionsFileName

General.Light2X
X position of light source 2
Default value: 0.5
Saved in: General.OptionsFileName
General.Light2Y
Y position of light source 2
Default value: 0.3
Saved in: General.OptionsFileName

General.Light2Z
Z position of light source 2
Default value: 1
Saved in: General.OptionsFileName

General.Light2W
Divisor of the X, Y and Z coordinates of light source 2 (W=0 means infinitely far source)
Default value: 0
Saved in: General.OptionsFileName

General.Light3
Enable light source 3
Default value: 0
Saved in: General.OptionsFileName

General.Light3X
X position of light source 3
Default value: 0.5
Saved in: General.OptionsFileName

General.Light3Y
Y position of light source 3
Default value: 0.3
Saved in: General.OptionsFileName

General.Light3Z
Z position of light source 3
Default value: 1
Saved in: General.OptionsFileName

General.Light3W
Divisor of the X, Y and Z coordinates of light source 3 (W=0 means infinitely far source)
Default value: 0
Saved in: General.OptionsFileName

General.Light4
Enable light source 4
Default value: 0
Saved in: General.OptionsFileName

General.Light4X
X position of light source 4
Default value: 0.5
Saved in: General.OptionsFileName

General.Light4Y
Y position of light source 4
Default value: 0.3
Saved in: General.OptionsFileName
General.Light4Z
Z position of light source 4
Default value: 1
Saved in: General.OptionsFileName

General.Light4W
Divisor of the X, Y and Z coordinates of light source 4 (W=0 means infinitely far source)
Default value: 0
Saved in: General.OptionsFileName

General.Light5
Enable light source 5
Default value: 0
Saved in: General.OptionsFileName

General.Light5X
X position of light source 5
Default value: 0.5
Saved in: General.OptionsFileName

General.Light5Y
Y position of light source 5
Default value: 0.3
Saved in: General.OptionsFileName

General.Light5Z
Z position of light source 5
Default value: 1
Saved in: General.OptionsFileName

General.Light5W
Divisor of the X, Y and Z coordinates of light source 5 (W=0 means infinitely far source)
Default value: 0
Saved in: General.OptionsFileName

General.LineWidth
Display width of lines (in pixels)
Default value: 1
Saved in: General.OptionsFileName

General.ManipulatorPositionX
Horizontal position (in pixels) of the upper left corner of the manipulator window
Default value: 650
Saved in: General.SessionFileName

General.ManipulatorPositionY
Vertical position (in pixels) of the upper left corner of the manipulator window
Default value: 150
Saved in: General.SessionFileName

General.MaxX
Maximum model coordinate along the X-axis (read-only)
Default value: 0
Saved in: -
**General.MaxY**
- Maximum model coordinate along the Y-axis (read-only)
- Default value: 0
- Saved in: -

**General.MaxZ**
- Maximum model coordinate along the Z-axis (read-only)
- Default value: 0
- Saved in: -

**General.MenuWidth**
- Width (in pixels) of the menu tree
- Default value: 200
- Saved in: *General.SessionFileName*

**General.MenuHeight**
- Height (in pixels) of the (detached) menu tree
- Default value: 200
- Saved in: *General.SessionFileName*

**General.MenuPositionX**
- Horizontal position (in pixels) of the (detached) menu tree
- Default value: 400
- Saved in: *General.SessionFileName*

**General.MenuPositionY**
- Vertical position (in pixels) of the (detached) menu tree
- Default value: 400
- Saved in: *General.SessionFileName*

**General.MessageFontSize**
- Size of the font in the message window, in pixels (-1: automatic)
- Default value: -1
- Saved in: *General.OptionsFileName*

**General.MessageHeight**
- Height (in pixels) of the message console when it is visible (should be > 0)
- Default value: 300
- Saved in: *General.SessionFileName*

**General.MinX**
- Minimum model coordinate along the X-axis (read-only)
- Default value: 0
- Saved in: -

**General.MinY**
- Minimum model coordinate along the Y-axis (read-only)
- Default value: 0
- Saved in: -

**General.MinZ**
- Minimum model coordinate along the Z-axis (read-only)
- Default value: 0
- Saved in: -

**General.MouseHoverMeshes**
- Enable mouse hover on meshes
- Default value: 0
- Saved in: *General.OptionsFileName*
General.MouseSelection
Enable mouse selection
Default value: 1
Saved in: General.OptionsFileName

General.MouseInvertZoom
Invert mouse wheel zoom direction
Default value: 0
Saved in: General.OptionsFileName

General.NativeFileChooser
Use the native file chooser?
Default value: 1
Saved in: General.SessionFileName

General.NonModalWindows
Force all control windows to be on top of the graphic window ("non-modal")
Default value: 1
Saved in: General.SessionFileName

General.NoPopup
Disable interactive dialog windows in scripts (and use default values instead)
Default value: 0
Saved in: General.OptionsFileName

General.NumThreads
Maximum number of threads used by Gmsh when compiled with OpenMP support
(0: use system default, i.e. OMP_NUM_THREADS)
Default value: 1
Saved in: General.OptionsFileName

General.OptionsPositionX
Horizontal position (in pixels) of the upper left corner of the option window
Default value: 650
Saved in: General.SessionFileName

General.OptionsPositionY
Vertical position (in pixels) of the upper left corner of the option window
Default value: 150
Saved in: General.SessionFileName

General.Orthographic
Orthographic projection mode (0: perspective projection)
Default value: 1
Saved in: General.OptionsFileName

General.PluginPositionX
Horizontal position (in pixels) of the upper left corner of the plugin window
Default value: 650
Saved in: General.SessionFileName

General.PluginPositionY
Vertical position (in pixels) of the upper left corner of the plugin window
Default value: 550
Saved in: General.SessionFileName
Chapter 7: Gmsh options

General.PluginHeight
Height (in pixels) of the plugin window
Default value: 320
Saved in: General.SessionFileName

General.PluginWidth
Width (in pixels) of the plugin window
Default value: 420
Saved in: General.SessionFileName

General.PointSize
Display size of points (in pixels)
Default value: 3
Saved in: General.OptionsFileName

General.PolygonOffsetAlwaysOn
Always apply polygon offset, instead of trying to detect when it is required
Default value: 0
Saved in: General.OptionsFileName

General.PolygonOffsetFactor
Polygon offset factor (offset = factor * DZ + r * units)
Default value: 0.5
Saved in: General.OptionsFileName

General.PolygonOffsetUnits
Polygon offset units (offset = factor * DZ + r * units)
Default value: 1
Saved in: General.OptionsFileName

General.ProgressMeterStep
Increment (in percent) of the progress meter bar
Default value: 10
Saved in: General.OptionsFileName

General.QuadricSubdivisions
Number of subdivisions used to draw points or lines as spheres or cylinders
Default value: 6
Saved in: General.OptionsFileName

General.RotationX
First Euler angle (used if Trackball=0)
Default value: 0
Saved in: -

General.RotationY
Second Euler angle (used if Trackball=0)
Default value: 0
Saved in: -

General.RotationZ
Third Euler angle (used if Trackball=0)
Default value: 0
Saved in: -

General.RotationCenterGravity
Rotate around the (pseudo) center of mass instead of (RotationCenterX, RotationCenterY, RotationCenterZ)
Default value: 1
Saved in: `General.OptionsFileName`

**General.RotationCenterX**  
X coordinate of the center of rotation  
Default value: 0  
Saved in: `-`

**General.RotationCenterY**  
Y coordinate of the center of rotation  
Default value: 0  
Saved in: `-`

**General.RotationCenterZ**  
Z coordinate of the center of rotation  
Default value: 0  
Saved in: `-`

**General.SaveOptions**  
Automatically save current options in `General.OptionsFileName` (1) or per model (2) when the graphical user interface is closed?  
Default value: 0  
Saved in: `General.SessionFileName`

**General.SaveSession**  
Automatically save session specific information in `General.SessionFileName` when the graphical user interface is closed?  
Default value: 1  
Saved in: `General.SessionFileName`

**General.ScaleX**  
X-axis scale factor  
Default value: 1  
Saved in: `-`

**General.ScaleY**  
Y-axis scale factor  
Default value: 1  
Saved in: `-`

**General.ScaleZ**  
Z-axis scale factor  
Default value: 1  
Saved in: `-`

**General.Shininess**  
Material shininess  
Default value: 0.4  
Saved in: `General.OptionsFileName`

**General.ShininessExponent**  
Material shininess exponent (between 0 and 128)  
Default value: 40  
Saved in: `General.OptionsFileName`

**General.ShowModuleMenu**  
Show the standard Gmsh menu in the tree  
Default value: 1  
Saved in: `General.OptionsFileName`
General.ShowOptionsOnStartup
  Show option window on startup
  Default value: 0
  Saved in: General.OptionsFileName

General.ShowMessagesOnStartup
  Show message window on startup
  Default value: 0
  Saved in: General.OptionsFileName

General.SmallAxes
  Display the small axes
  Default value: 1
  Saved in: General.OptionsFileName

General.SmallAxesPositionX
  X position (in pixels) of small axes (< 0: measure from right window edge; >= 1e5: centered)
  Default value: -60
  Saved in: General.OptionsFileName

General.SmallAxesPositionY
  Y position (in pixels) of small axes (< 0: measure from bottom window edge; >= 1e5: centered)
  Default value: -40
  Saved in: General.OptionsFileName

General.SmallAxesSize
  Size (in pixels) of small axes
  Default value: 30
  Saved in: General.OptionsFileName

General.StatisticsPositionX
  Horizontal position (in pixels) of the upper left corner of the statistic window
  Default value: 650
  Saved in: General.SessionFileName

General.StatisticsPositionY
  Vertical position (in pixels) of the upper left corner of the statistic window
  Default value: 150
  Saved in: General.SessionFileName

General.Stereo
  Use stereo rendering
  Default value: 0
  Saved in: General.OptionsFileName

General.SystemMenuBar
  Use the system menu bar on macOS?
  Default value: 1
  Saved in: General.SessionFileName

General.Terminal
  Should information be printed on the terminal (if available)?
  Default value: 0
  Saved in: General.OptionsFileName
General.Tooltips
    Show tooltips in the user interface
    Default value: 1
    Saved in: General.OptionsFileName

General.Trackball
    Use trackball rotation mode
    Default value: 1
    Saved in: General.OptionsFileName

General.TrackballHyperbolicSheet
    Use hyperbolic sheet away from trackball center for z-rotations
    Default value: 1
    Saved in: General.OptionsFileName

General.TrackballQuaternion0
    First trackball quaternion component (used if General.Trackball=1)
    Default value: 0
    Saved in: -

General.TrackballQuaternion1
    Second trackball quaternion component (used if General.Trackball=1)
    Default value: 0
    Saved in: -

General.TrackballQuaternion2
    Third trackball quaternion component (used if General.Trackball=1)
    Default value: 0
    Saved in: -

General.TrackballQuaternion3
    Fourth trackball quaternion component (used if General.Trackball=1)
    Default value: 1
    Saved in: -

General.TranslationX
    X-axis translation (in model units)
    Default value: 0
    Saved in: -

General.TranslationY
    Y-axis translation (in model units)
    Default value: 0
    Saved in: -

General.TranslationZ
    Z-axis translation (in model units)
    Default value: 0
    Saved in: -

General.VectorType
    Default vector display type (for normals, etc.)
    Default value: 4
    Saved in: General.OptionsFileName

General.Verbosity
    Level of information printed on the terminal and the message console (0: silent except for fatal errors, 1: +errors, 2: +warnings, 3: +direct, 4: +information, 5:
+status, 99: +debug)
Default value: 5
Saved in: General.OptionsFileName

General.VisibilityPositionX
  Horizontal position (in pixels) of the upper left corner of the visibility window
Default value: 650
Saved in: General.SessionFileName

General.VisibilityPositionY
  Vertical position (in pixels) of the upper left corner of the visibility window
Default value: 150
Saved in: General.SessionFileName

General.ZoomFactor
  Middle mouse button zoom acceleration factor
Default value: 4
Saved in: General.OptionsFileName

General.Color.Background
  Background color
Default value: {255,255,255}
Saved in: General.OptionsFileName

General.Color.BackgroundGradient
  Background gradient color
Default value: {208,215,255}
Saved in: General.OptionsFileName

General.Color.Foreground
  Foreground color
Default value: {85,85,85}
Saved in: General.OptionsFileName

General.Color.Text
  Text color
Default value: {0,0,0}
Saved in: General.OptionsFileName

General.Color.Axes
  Axes color
Default value: {0,0,0}
Saved in: General.OptionsFileName

General.Color.SmallAxes
  Small axes color
Default value: {0,0,0}
Saved in: General.OptionsFileName

General.Color.AmbientLight
  Ambient light color
Default value: {25,25,25}
Saved in: General.OptionsFileName

General.Color.DiffuseLight
  Diffuse light color
Default value: {255,255,255}
Saved in: General.OptionsFileName
General.Color.SpecularLight
    Specular light color
    Default value: \{255,255,255\}
    Saved in: General.OptionsFileName

7.2 Print options

Print.ParameterCommand
    Command parsed when the print parameter is changed
    Default value: "Mesh.Clip=1; View.Clip=1; General.ClipWholeElements=1;
                 General.Clip0D=Print.Parameter; SetChanged;"
    Saved in: General.OptionsFileName

Print.Parameter
    Current value of the print parameter
    Default value: 0
    Saved in: General.OptionsFileName

Print.ParameterFirst
    First value of print parameter in loop
    Default value: -1
    Saved in: General.OptionsFileName

Print.ParameterLast
    Last value of print parameter in loop
    Default value: 1
    Saved in: General.OptionsFileName

Print.ParameterSteps
    Number of steps in loop over print parameter
    Default value: 10
    Saved in: General.OptionsFileName

Print.Background
    Print background (gradient and image)?
    Default value: 0
    Saved in: General.OptionsFileName

Print.CompositeWindows
    Composite all window tiles in the same output image (for bitmap output only)
    Default value: 0
    Saved in: General.OptionsFileName

Print.DeleteTemporaryFiles
    Delete temporary files used during printing
    Default value: 1
    Saved in: General.OptionsFileName

Print.EpsBestRoot
    Try to minimize primitive splitting in BSP tree sorted PostScript/PDF output
    Default value: 1
    Saved in: General.OptionsFileName

Print.EpsCompress
    Compress PostScript/PDF output using zlib
    Default value: 0
    Saved in: General.OptionsFileName
Chapter 7: Gmsh options

Print.EpsLineWidthFactor
Width factor for lines in PostScript/PDF output
Default value: 1
Saved in: General.OptionsFileName

Print.EpsOcclusionCulling
Cull occluded primitives (to reduce PostScript/PDF file size)
Default value: 1
Saved in: General.OptionsFileName

Print.EpsPointSizeFactor
Size factor for points in PostScript/PDF output
Default value: 1
Saved in: General.OptionsFileName

Print.EpsPS3Shading
Enable PostScript Level 3 shading
Default value: 0
Saved in: General.OptionsFileName

Print.EpsQuality
PostScript/PDF quality (0: bitmap, 1: vector (simple sort), 2: vector (accurate sort), 3: vector (unsorted))
Default value: 1
Saved in: General.OptionsFileName

Print.Format
File format (10: automatic)
Default value: 10
Saved in: General.OptionsFileName

Print.GeoLabels
Save labels in unrolled Gmsh geometries
Default value: 1
Saved in: General.OptionsFileName

Print.GeoOnlyPhysicals
Only save entities that belong to physical groups
Default value: 0
Saved in: General.OptionsFileName

Print.GifDither
Apply dithering to GIF output
Default value: 0
Saved in: General.OptionsFileName

Print.GifInterlace
Interlace GIF output
Default value: 0
Saved in: General.OptionsFileName

Print.GifSort
Sort the colormap in GIF output
Default value: 1
Saved in: General.OptionsFileName
Print.GifTransparent
Output transparent GIF image
Default value: 0
Saved in: General.OptionsFileName

Print.Height
Height of printed image; use (possibly scaled) current height if < 0
Default value: -1
Saved in: General.OptionsFileName

Print.JpegQuality
JPEG quality (between 1 and 100)
Default value: 100
Saved in: General.OptionsFileName

Print.JpegSmoothing
JPEG smoothing (between 0 and 100)
Default value: 0
Saved in: General.OptionsFileName

Print.PgfTwoDim
Output PGF format for two dimensions. Mostly irrelevant if ‘PgfExportAxis=0’.
Default ‘1’ (yes).
Default value: 1
Saved in: General.OptionsFileName

Print.PgfExportAxis
Include axis in export pgf code (not in the png). Default ‘0’ (no).
Default value: 0
Saved in: General.OptionsFileName

Print.PgfHorizontalBar
Use a horizontal color bar in the pgf output. Default ‘0’ (no).
Default value: 0
Saved in: General.OptionsFileName

Print.PostElementary
Save elementary region tags in mesh statistics exported as post-processing views
Default value: 1
Saved in: General.OptionsFileName

Print.PostElement
Save element tags in mesh statistics exported as post-processing views
Default value: 0
Saved in: General.OptionsFileName

Print.PostGamma
Save Gamma quality measure in mesh statistics exported as post-processing views
Default value: 0
Saved in: General.OptionsFileName

Print.PostEta
Save Eta quality measure in mesh statistics exported as post-processing views
Default value: 0
Saved in: General.OptionsFileName

Print.PostSICN
Save SICN (signed inverse condition number) quality measure in mesh statistics exported as post-processing views
Default value: 0
Saved in: General.OptionsFileName

Print.PostSIGE
Save SIGE (signed inverse gradient error) quality measure in mesh statistics exported as post-processing views
Default value: 0
Saved in: General.OptionsFileName

Print.PostDisto
Save Disto quality measure in mesh statistics exported as post-processing views
Default value: 0
Saved in: General.OptionsFileName

Print.TexAsEquation
Print all TeX strings as equations
Default value: 0
Saved in: General.OptionsFileName

Print.TexForceFontSize
Force font size of TeX strings to fontsize in the graphic window
Default value: 0
Saved in: General.OptionsFileName

Print.TexWidthInMm
Width of tex graphics in mm (use 0 for the natural width inferred from the image width in pixels)
Default value: 150
Saved in: General.OptionsFileName

Print.Text
Print text strings?
Default value: 1
Saved in: General.OptionsFileName

Print.X3dCompatibility
Produce highly compatible X3D output (no scale bar)
Default value: 0
Saved in: General.OptionsFileName

Print.X3dPrecision
Precision of X3D output
Default value: 1e-09
Saved in: General.OptionsFileName

Print.X3dRemoveInnerBorders
Remove inner borders in X3D output
Default value: 0
Saved in: General.OptionsFileName

Print.X3dTransparency
Transparency for X3D output
Default value: 0
Saved in: General.OptionsFileName

Print.X3dSurfaces
Save surfaces in CAD X3D output (0: no, 1: yes in a single X3D object, 2: one X3D object per geometrical surface, 3: one X3D object per physical surface)
Default value: 1
Saved in: General.OptionsFileName

Print.X3dEdges
Save edges in CAD X3D output (0: no, 1: yes in a single X3D object, 2: one X3D object per geometrical edge, 3: one X3D object per physical edge)
Default value: 0
Saved in: General.OptionsFileName

Print.X3dVertices
Save vertices in CAD X3D output (0: no, 1: yes)
Default value: 0
Saved in: General.OptionsFileName

Print.X3dVolumes
Save separate volumes in CAD X3D output (0: no, 1: yes)
Default value: 0
Saved in: General.OptionsFileName

Print.X3dColorize
Apply colors to faces (0: no, 1: yes)
Default value: 0
Saved in: General.OptionsFileName

Print.Width
Width of printed image; use (possibly scaled) current width if < 0)
Default value: -1
Saved in: General.OptionsFileName

7.3 Geometry options

Geometry.DoubleClickedPointCommand
Command parsed when double-clicking on a point, or 'ONELAB' to edit associated ONELAB parameters
Default value: "ONELAB"
Saved in: General.OptionsFileName

Geometry.DoubleClickedCurveCommand
Command parsed when double-clicking on a curve, or 'ONELAB' to edit associated ONELAB parameters
Default value: "ONELAB"
Saved in: General.OptionsFileName

Geometry.DoubleClickedSurfaceCommand
Command parsed when double-clicking on a surface, or 'ONELAB' to edit associated ONELAB parameters
Default value: "ONELAB"
Saved in: General.OptionsFileName

Geometry.DoubleClickedVolumeCommand
Command parsed when double-clicking on a volume, or 'ONELAB' to edit associated ONELAB parameters
Default value: "ONELAB"
Saved in: General.OptionsFileName

Geometry.OCCTargetUnit
Length unit to which coordinates from STEP and IGES files are converted to when imported by OpenCASCADE, e.g. 'M' for meters (leave empty to use the default
OpenCASCADE behavior); the option should be set before importing the STEP or IGES file
Default value: ""
Saved in: General.OptionsFileName

Geometry.PipeDefaultTrihedron
Default trihedron type when creating pipes
Default value: "DiscreteTrihedron"
Saved in: General.OptionsFileName

Geometry.AutoCoherence
Should all duplicate entities be automatically removed with the built-in geometry kernel? If Geometry.AutoCoherence = 2, also remove degenerate entities. The option has no effect with the OpenCASCADE kernel
Default value: 1
Saved in: General.OptionsFileName

Geometry.Clip
Enable clipping planes? (Plane[i]=2^i, i=0,...,5)
Default value: 0
Saved in: -

Geometry.CopyMeshingMethod
Copy meshing method (unstructured or transfinite) when duplicating geometrical entities with built-in geometry kernel?
Default value: 0
Saved in: General.OptionsFileName

Geometry.Curves
Display geometry curves?
Default value: 1
Saved in: General.OptionsFileName

Geometry.CurveLabels
Display curve labels?
Default value: 0
Saved in: General.OptionsFileName

Geometry.CurveSelectWidth
Display width of selected curves (in pixels)
Default value: 3
Saved in: General.OptionsFileName

Geometry.CurveType
Display curves as solid color segments (0) or 3D cylinders (1)
Default value: 0
Saved in: General.OptionsFileName

Geometry.CurveWidth
Display width of lines (in pixels)
Default value: 2
Saved in: General.OptionsFileName

Geometry.DoubleClickedEntityTag
Tag of last double-clicked geometrical entity
Default value: 0
Saved in: -
Geometry.ExactExtrusion
Use exact extrusion formula in interpolations (set to 0 to allow geometrical transformations of extruded entities)
Default value: 1
Saved in: General.OptionsFileName

Geometry.ExtrudeReturnLateralEntities
Add lateral entities in lists returned by extrusion commands?
Default value: 1
Saved in: General.OptionsFileName

Geometry.ExtrudeSplinePoints
Number of control points for splines created during extrusion
Default value: 5
Saved in: General.OptionsFileName

Geometry.HighlightOrphans
Highlight orphan and boundary entities?
Default value: 0
Saved in: General.OptionsFileName

Geometry.LabelType
Type of entity label (0: description, 1: elementary entity tag, 2: physical group tag, 3: elementary name, 4: physical name)
Default value: 0
Saved in: General.OptionsFileName

Geometry.Light
Enable lighting for the geometry
Default value: 1
Saved in: General.OptionsFileName

Geometry.LightTwoSide
Light both sides of surfaces (leads to slower rendering)
Default value: 1
Saved in: General.OptionsFileName

Geometry.MatchGeomAndMesh
Matches geometries and meshes
Default value: 0
Saved in: General.OptionsFileName

Geometry.MatchMeshScaleFactor
Rescaling factor for the mesh to correspond to size of the geometry
Default value: 1
Saved in: General.OptionsFileName

Geometry.MatchMeshTolerance
Tolerance for matching mesh and geometry
Default value: 1e-06
Saved in: General.OptionsFileName

Geometry.Normals
Display size of normal vectors (in pixels)
Default value: 0
Saved in: General.OptionsFileName
Geometry.NumSubEdges
   Number of subdivisions (per control point or pole) used to draw curves
   Default value: 40
   Saved in: General.OptionsFileName

Geometry.OCCAutoEmbed
   Automatically embed points, curves and faces in higher dimensional entities if they
   are marked as 'internal' by OpenCASCADE
   Default value: 1
   Saved in: General.OptionsFileName

Geometry.OCCAutoFix
   Automatically fix orientation of wires, faces, shells and volumes when creating new
   entities with the OpenCASCADE kernel
   Default value: 1
   Saved in: General.OptionsFileName

Geometry.OCCBooleanPreserveNumbering
   Try to preserve the numbering of entities through OpenCASCADE boolean operations
   Default value: 1
   Saved in: General.OptionsFileName

Geometry.OCCBoundsUseStl
   Use STL mesh for computing bounds of OpenCASCADE shapes (more accurate,
   but slower)
   Default value: 0
   Saved in: General.OptionsFileName

Geometry.OCCDisableStl
   Disable STL creation in OpenCASCADE kernel
   Default value: 0
   Saved in: General.OptionsFileName

Geometry.OCCFixDegenerated
   Fix degenerated edges/faces when importing STEP, IGES and BRep models with
   the OpenCASCADE kernel
   Default value: 0
   Saved in: General.OptionsFileName

Geometry.OCCFixSmallEdges
   Fix small edges when importing STEP, IGES and BRep models with the OpenCAS-
   CADE kernel
   Default value: 0
   Saved in: General.OptionsFileName

Geometry.OCCFixSmallFaces
   Fix small faces when importing STEP, IGES and BRep models with the OpenCAS-
   CADE kernel
   Default value: 0
   Saved in: General.OptionsFileName

Geometry.OCCExportOnlyVisible
   Only consider visible shapes when exporting STEP or BREP models with the Open-
   CADE kernel
   Default value: 0
   Saved in: General.OptionsFileName
Geometry.OCCImportLabels
  Import labels and colors when importing STEP models with the OpenCASCADEx kernel
  Default value: 1
  Saved in: General.OptionsFileName

Geometry.OCCMakeSolids
  Fix shells and make solids when importing STEP, IGES and BRep models with the
  OpenCASCADEx kernel
  Default value: 0
  Saved in: General.OptionsFileName

Geometry.OCCParallel
  Use multi-threaded OpenCASCADEx boolean operators
  Default value: 0
  Saved in: General.OptionsFileName

Geometry.OCCFastUnbind
  Use fast (i.e. without recursive checks on boundaries) unbinding of entities in geo-
  metrical transformations (1), as well as in boolean operations (2)
  Default value: 1
  Saved in: General.OptionsFileName

Geometry.OCCScaling
  Scale STEP, IGES and BRep models by the given factor when importing them with
  the OpenCASCADEx kernel
  Default value: 1
  Saved in: General.OptionsFileName

Geometry.OCCSewFaces
  Sew faces when importing STEP, IGES and BRep models with the OpenCASCADEx kernel
  Default value: 0
  Saved in: General.OptionsFileName

Geometry.OCCThruSectionsDegree
  Maximum degree of surfaces generated by thrusections with the OpenCASCADEx kernel,
  if not explicitly specified (default OCC value if negative)
  Default value: -1
  Saved in: General.OptionsFileName

Geometry.OCCUnionUnify
  Try to unify faces and edges (remove internal seams) which lie on the same geometry
  after performing a boolean union with the OpenCASCADEx kernel
  Default value: 1
  Saved in: General.OptionsFileName

Geometry.OCCUseGenericClosestPoint
  Use generic algorithm to compute point projections in the OpenCASCADEx kernel
  (less robust, but significantly faster in some configurations)
  Default value: 0
  Saved in: General.OptionsFileName

Geometry.OffsetX
  Model display offset along X-axis (in model coordinates)
  Default value: 0
  Saved in: -
Geometry.OffsetY
Model display offset along Y-axis (in model coordinates)
Default value: 0
Saved in: -

Geometry.OffsetZ
Model display offset along Z-axis (in model coordinates)
Default value: 0
Saved in: -

Geometry.OldCircle
Use old circle description (compatibility option for old Gmsh geometries)
Default value: 0
Saved in: General.OptionsFileName

Geometry.OldRuledSurface
Use old 3-sided ruled surface interpolation (compatibility option for old Gmsh geometries)
Default value: 0
Saved in: General.OptionsFileName

Geometry.OldNewReg
Use old newreg definition for geometrical transformations (compatibility option for old Gmsh geometries)
Default value: 1
Saved in: General.OptionsFileName

Geometry.OrientedPhysicals
Use sign of elementary entity in physical definition as orientation indicator
Default value: 1
Saved in: General.OptionsFileName

Geometry.Points
Display geometry points?
Default value: 1
Saved in: General.OptionsFileName

Geometry.PointLabels
Display points labels?
Default value: 0
Saved in: General.OptionsFileName

Geometry.PointSelectSize
Display size of selected points (in pixels)
Default value: 6
Saved in: General.OptionsFileName

Geometry.PointSize
Display size of points (in pixels)
Default value: 4
Saved in: General.OptionsFileName

Geometry.PointType
Display points as solid color dots (0) or 3D spheres (1)
Default value: 0
Saved in: General.OptionsFileName
Geometry.ReparamOnFaceRobust
Use projection for reparametrization of a point classified on GEdge on a GFace
Default value: 0
Saved in: General.Options FileName

Geometry.ScalingFactor
Global geometry scaling factor
Default value: 1
Saved in: General.Options FileName

Geometry.SnapPoints
Snap points on curves if their evaluation using the parametrization is larger than
the geometrical tolerance (currently only with the OpenCASCADE kernel)
Default value: 1
Saved in: General.Options FileName

Geometry.SnapX
Snapping grid spacing along the X-axis
Default value: 0.1
Saved in: General.Options FileName

Geometry.SnapY
Snapping grid spacing along the Y-axis
Default value: 0.1
Saved in: General.Options FileName

Geometry.SnapZ
Snapping grid spacing along the Z-axis
Default value: 0.1
Saved in: General.Options FileName

Geometry.Surfaces
Display geometry surfaces?
Default value: 0
Saved in: General.Options FileName

Geometry.SurfaceLabels
Display surface labels?
Default value: 0
Saved in: General.Options FileName

Geometry.SurfaceType
Surface display type (0: cross, 1: wireframe, 2: solid). Wireframe and solid are not
available with the built-in geometry kernel.
Default value: 0
Saved in: General.Options FileName

Geometry.Tangents
Display size of tangent vectors (in pixels)
Default value: 0
Saved in: General.Options FileName

Geometry.Tolerance
Geometrical tolerance
Default value: 1e-08
Saved in: General.Options FileName
Geometry.ToleranceBoolean
    Geometrical tolerance for boolean operations
    Default value: 0
    Saved in: General.OptionsFileName

Geometry.Transform
    Transform model display coordinates (0: no, 1: scale)
    Default value: 0
    Saved in: -

Geometry.TransformXX
    Element (1,1) of the 3x3 model display transformation matrix
    Default value: 1
    Saved in: -

Geometry.TransformXY
    Element (1,2) of the 3x3 model display transformation matrix
    Default value: 0
    Saved in: -

Geometry.TransformXZ
    Element (1,3) of the 3x3 model display transformation matrix
    Default value: 0
    Saved in: -

Geometry.TransformYX
    Element (2,1) of the 3x3 model display transformation matrix
    Default value: 0
    Saved in: -

Geometry.TransformYY
    Element (2,2) of the 3x3 model display transformation matrix
    Default value: 1
    Saved in: -

Geometry.TransformYZ
    Element (2,3) of the 3x3 model display transformation matrix
    Default value: 0
    Saved in: -

Geometry.TransformZX
    Element (3,1) of the 3x3 model display transformation matrix
    Default value: 0
    Saved in: -

Geometry.TransformZY
    Element (3,2) of the 3x3 model display transformation matrix
    Default value: 0
    Saved in: -

Geometry.TransformZZ
    Element (3,3) of the 3x3 model display transformation matrix
    Default value: 1
    Saved in: -

Geometry.Volumes
    Display geometry volumes?
    Default value: 0
    Saved in: General.OptionsFileName
Geometry.VolumeLabels
  Display volume labels?
  Default value: 0
  Saved in: General.OptionsFileName

Geometry.VolumeType
  Volume display type (0: sphere, 1: diamond)
  Default value: 0
  Saved in: General.OptionsFileName

Geometry.Color.Points
  Normal geometry point color
  Default value: {90,90,90}
  Saved in: General.OptionsFileName

Geometry.Color.Curves
  Normal geometry curve color
  Default value: {0,0,255}
  Saved in: General.OptionsFileName

Geometry.Color.Surfaces
  Normal geometry surface color
  Default value: {128,128,128}
  Saved in: General.OptionsFileName

Geometry.Color.Volumes
  Normal geometry volume color
  Default value: {200,200,0}
  Saved in: General.OptionsFileName

Geometry.Color.Selection
  Selected geometry color
  Default value: {255,0,0}
  Saved in: General.OptionsFileName

Geometry.Color.HighlightZero
  Highlight 0 color
  Default value: {255,0,0}
  Saved in: General.OptionsFileName

Geometry.Color.HighlightOne
  Highlight 1 color
  Default value: {255,150,0}
  Saved in: General.OptionsFileName

Geometry.Color.HighlightTwo
  Highlight 2 color
  Default value: {255,255,0}
  Saved in: General.OptionsFileName

Geometry.Color.Tangents
  Tangent geometry vectors color
  Default value: {255,255,0}
  Saved in: General.OptionsFileName

Geometry.Color.Normals
  Normal geometry vectors color
  Default value: {255,0,0}
  Saved in: General.OptionsFileName
7.4 Mesh options

Mesh.Algorithm
Default value: 6
Saved in: General.OptionsFileName

Mesh.Algorithm3D
3D mesh algorithm (1: Delaunay, 3: Initial mesh only, 4: Frontal, 7: MMG3D, 9: R-tree, 10: HXT)
Default value: 1
Saved in: General.OptionsFileName

Mesh.AlgorithmSwitchOnFailure
Switch meshing algorithm on failure? (Currently only for 2D Delaunay-based algorithms, switching to MeshAdapt)
Default value: 1
Saved in: General.OptionsFileName

Mesh.AngleSmoothNormals
Threshold angle below which normals are not smoothed
Default value: 30
Saved in: General.OptionsFileName

Mesh.AngleToleranceFacetOverlap
Consider connected facets as overlapping when the dihedral angle between the facets is smaller than the user’s defined tolerance (in degrees)
Default value: 0.1
Saved in: General.OptionsFileName

Mesh.AnisoMax
Maximum anisotropy of the mesh
Default value: 1e+33
Saved in: General.OptionsFileName

Mesh.AllowSwapAngle
Threshold angle (in degrees) between faces normals under which we allow an edge swap
Default value: 10
Saved in: General.OptionsFileName

Mesh.BdfFieldFormat
Field format for Nastran BDF files (0: free, 1: small, 2: large)
Default value: 1
Saved in: General.OptionsFileName

Mesh.Binary
Write mesh files in binary format (if possible)
Default value: 0
Saved in: General.OptionsFileName
Mesh.BoundaryLayerFanElements
Number of elements (per Pi radians) for 2D boundary layer fans
Default value: 5
Saved in: General.OptionsFileName

Mesh.CgnsImportOrder
Order of the mesh to be created by coarsening CGNS structured zones (1 to 4)
Default value: 1
Saved in: General.OptionsFileName

Mesh.CgnsImportIgnoreBC
Ignore information in ZoneBC structures when reading a CGNS file
Default value: 0
Saved in: General.OptionsFileName

Mesh.CgnsImportIgnoreSolution
Ignore solution when reading a CGNS file
Default value: 0
Saved in: General.OptionsFileName

Mesh.CgnsConstructTopology
Reconstruct the model topology (BREP) after reading a CGNS file
Default value: 0
Saved in: General.OptionsFileName

Mesh.CgnsExportCPEX0045
Use the CPEX0045 convention when exporting a high-order mesh to CGNS
Default value: 0
Saved in: General.OptionsFileName

Mesh.CgnsExportStructured
Export transfinite meshes as structured CGNS grids
Default value: 0
Saved in: General.OptionsFileName

Mesh.CheckSurfaceNormalValidity
Check surface mesh validity according to the geometry normal
Default value: 1
Saved in: General.OptionsFileName

Mesh.Clip
Enable clipping planes? (Plane[i]=2^i, i=0,...,5)
Default value: 0
Saved in: -

Mesh.ColorCarousel
Mesh coloring (0: by element type, 1: by elementary entity, 2: by physical group, 3: by mesh partition)
Default value: 1
Saved in: General.OptionsFileName

Mesh.CompoundClassify
How are surface mesh elements classified on compounds? (0: on the new discrete surface, 1: on the original geometrical surfaces - incompatible with e.g. high-order meshing)
Default value: 1
Saved in: General.OptionsFileName
Mesh.CompoundMeshSizeFactor
Mesh size factor applied to compound parts
Default value: 0.5
Saved in: General.OptionsFileName

Mesh.CpuTime
CPU time (in seconds) for the generation of the current mesh (read-only)
Default value: 0
Saved in: -

Mesh.CreateTopologyMsh2
Attempt to (re)create the model topology when reading MSH2 files
Default value: 0
Saved in: General.OptionsFileName

Mesh.DrawSkinOnly
Draw only the skin of 3D meshes?
Default value: 0
Saved in: General.OptionsFileName

Mesh.Dual
Display the dual mesh obtained by barycentric subdivision
Default value: 0
Saved in: General.OptionsFileName

Mesh.ElementOrder
Element order (1: first order elements)
Default value: 1
Saved in: General.OptionsFileName

Mesh.Explose
Element shrinking factor (between 0 and 1)
Default value: 1
Saved in: General.OptionsFileName

Mesh.FirstElementTag
First tag (>= 1) of mesh elements when generating or renumbering a mesh
Default value: 1
Saved in: General.OptionsFileName

Mesh.FirstNodeTag
First tag (>= 1) of mesh nodes when generating or renumbering a mesh
Default value: 1
Saved in: General.OptionsFileName

Mesh.FlexibleTransfinite
Allow transfinite constraints to be modified for recombination (e.g. Blossom) or by global mesh size factor
Default value: 0
Saved in: General.OptionsFileName

Mesh.Format
Default value: 10
Saved in: General.OptionsFileName
Mesh.Hexahedra
Display mesh hexahedra?
Default value: 1
Saved in: General.OptionsFileName

Mesh.HighOrderDistCAD
Try to optimize distance to CAD in high-order optimizer?
Default value: 0
Saved in: General.OptionsFileName

Mesh.HighOrderFixBoundaryNodes
Fix all (1) or periodic (2) boundary nodes during high-order optimization?
Default value: 0
Saved in: General.OptionsFileName

Mesh.HighOrderIterMax
Maximum number of iterations in high-order optimization pass
Default value: 100
Saved in: General.OptionsFileName

Mesh.HighOrderNumLayers
Number of layers around a problematic element to consider for high-order optimization, or number of element layers to consider in the boundary layer mesh for high-order fast curving
Default value: 6
Saved in: General.OptionsFileName

Mesh.HighOrderOptimize
Optimize high-order meshes? (0: none, 1: optimization, 2: elastic+optimization, 3: elastic, 4: fast curving)
Default value: 0
Saved in: General.OptionsFileName

Mesh.HighOrderPassMax
Maximum number of high-order optimization passes (moving barrier)
Default value: 25
Saved in: General.OptionsFileName

Mesh.HighOrderPeriodic
Force location of nodes for periodic meshes using periodicity transform (0: assume identical parametrisations, 1: invert parametrisations, 2: compute closest point
Default value: 0
Saved in: General.OptionsFileName

Mesh.HighOrderPoissonRatio
Poisson ratio of the material used in the elastic smoother for high-order meshes (between -1.0 and 0.5, excluded)
Default value: 0.33
Saved in: General.OptionsFileName

Mesh.HighOrderSavePeriodic
Save high-order nodes in periodic section of MSH files?
Default value: 0
Saved in: General.OptionsFileName
Mesh.HighOrderPrimSurfMesh
Try to fix flipped surface mesh elements in high-order optimizer?
Default value: 0
Saved in: General.OptionsFileName

Mesh.HighOrderThresholdMin
Minimum threshold for high-order element optimization
Default value: 0.1
Saved in: General.OptionsFileName

Mesh.HighOrderThresholdMax
Maximum threshold for high-order element optimization
Default value: 2
Saved in: General.OptionsFileName

Mesh.HighOrderFastCurvingNewAlgo
Curve boundary layer with new “fast curving” algorithm (experimental)
Default value: 0
Saved in: General.OptionsFileName

Mesh.HighOrderCurveOuterBL
Curve also the outer surface of the boundary layer in the fast curving algorithm (0 = do not curve, 1 = curve according to boundary, 2 = curve without breaking outer elements)
Default value: 0
Saved in: General.OptionsFileName

Mesh.HighOrderMaxRho
Maximum min/max ratio of edge/face size for the detection of BL element columns in the fast curving algorithm
Default value: 0.3
Saved in: General.OptionsFileName

Mesh.HighOrderMaxAngle
Maximum angle between layers of BL elements for the detection of columns in the fast curving algorithm
Default value: 0.174533
Saved in: General.OptionsFileName

Mesh.HighOrderMaxInnerAngle
Maximum angle between edges/faces within layers of BL triangles/tets for the detection of columns in the fast curving algorithm
Default value: 0.523599
Saved in: General.OptionsFileName

Mesh.IgnoreParametrization
Skip parametrization section when reading meshes in the MSH4 format
Default value: 0
Saved in: General.OptionsFileName

Mesh.IgnorePeriodicity
Skip periodic node section and skip periodic boundary alignment step when reading meshes in the MSH2 format
Default value: 1
Saved in: General.OptionsFileName
Mesh.LabelSampling
Label sampling rate (display one label every ‘LabelSampling’ elements)
Default value: 1
Saved in: General.OptionsFileName

Mesh.LabelType
Type of element label (0: node/element tag, 1: elementary entity tag, 2: physical entity tag, 3: partition, 4: coordinates)
Default value: 0
Saved in: General.OptionsFileName

Mesh.LcIntegrationPrecision
Accuracy of evaluation of the LC field for 1D mesh generation
Default value: 1e-09
Saved in: General.OptionsFileName

Mesh.Light
Enable lighting for the mesh
Default value: 1
Saved in: General.OptionsFileName

Mesh.LightLines
Enable lighting for mesh edges (0: no, 1: surfaces, 2: surfaces+volumes
Default value: 2
Saved in: General.OptionsFileName

Mesh.LightTwoSide
Light both sides of surfaces (leads to slower rendering)
Default value: 1
Saved in: General.OptionsFileName

Mesh.Lines
Display mesh lines (1D elements)?
Default value: 0
Saved in: General.OptionsFileName

Mesh.LineLabels
Display mesh line labels?
Default value: 0
Saved in: General.OptionsFileName

Mesh.LineWidth
Display width of mesh lines (in pixels)
Default value: 1
Saved in: General.OptionsFileName

Mesh.MaxIterDelaunay3D
Maximum number of point insertion iterations in 3D Delaunay mesher (0: unlimited)
Default value: 0
Saved in: General.OptionsFileName

Mesh.MaxNumThreads1D
Maximum number of threads for 1D meshing (0: use General.NumThreads)
Default value: 0
Saved in: General.OptionsFileName
Mesh.MaxNumThreads2D
  Maximum number of threads for 2D meshing (0: use General.NumThreads)
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.MaxNumThreads3D
  Maximum number of threads for 3D meshing (0: use General.NumThreads)
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.MaxRetries
  Maximum number of times meshing is retried on curves and surfaces with a pending mesh
  Default value: 10
  Saved in: General.OptionsFileName

Mesh.MeshOnlyVisible
  Mesh only visible entities (experimental)
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.MeshOnlyEmpty
  Mesh only entities that have no existing mesh
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.MeshSizeExtendFromBoundary
  Extend computation of mesh element sizes from the boundaries into the interior (0: never; 1: for surfaces and volumes; 2: for surfaces and volumes, but use smallest surface element edge length instead of longest length in 3D Delaunay; -2: only for surfaces; -3: only for volumes)
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.MeshSizeFactor
  Factor applied to all mesh element sizes
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.MeshSizeMin
  Minimum mesh element size
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.MeshSizeMax
  Maximum mesh element size
  Default value: 1e+22
  Saved in: General.OptionsFileName

Mesh.MeshSizeFromCurvature
  Automatically compute mesh element sizes from curvature, using the value as the target number of elements per 2 * Pi radians
  Default value: 0
  Saved in: General.OptionsFileName
Mesh.MeshSizeFromCurvatureIsotropic
Force isotropic curvature estimation when the mesh size is computed from curvature
Default value: 0
Saved in: General.OptionsFileName

Mesh.MeshSizeFromPoints
Compute mesh element sizes from values given at geometry points
Default value: 1
Saved in: General.OptionsFileName

Mesh.MeshSizeFromParametricPoints
Compute mesh element sizes from values given at geometry points defining parametric curves
Default value: 0
Saved in: General.OptionsFileName

Mesh.MetisAlgorithm
METIS partitioning algorithm 'ptype' (1: Recursive, 2: K-way)
Default value: 1
Saved in: General.OptionsFileName

Mesh.MetisEdgeMatching
METIS edge matching type 'ctype' (1: Random, 2: Sorted Heavy-Edge)
Default value: 2
Saved in: General.OptionsFileName

Mesh.MetisMaxLoadImbalance
METIS maximum load imbalance 'ufactor' (-1: default, i.e. 30 for K-way and 1 for Recursive)
Default value: -1
Saved in: General.OptionsFileName

Mesh.MetisObjective
METIS objective type 'objtype' (1: min. edge-cut, 2: min. communication volume)
Default value: 1
Saved in: General.OptionsFileName

Mesh.MetisMinConn
METIS minimize maximum connectivity of partitions 'minconn' (-1: default)
Default value: -1
Saved in: General.OptionsFileName

Mesh.MetisRefinementAlgorithm
METIS algorithm for k-way refinement 'rtype' (1: FM-based cut, 2: Greedy, 3: Two-sided node FM, 4: One-sided node FM)
Default value: 2
Saved in: General.OptionsFileName

Mesh.MinimumLineNodes
Minimum number of nodes used to mesh (straight) lines
Default value: 2
Saved in: General.OptionsFileName

Mesh.MinimumCircleNodes
Minimum number of nodes used to mesh circles and ellipses
Default value: 7
Saved in: General.OptionsFileName
Mesh.MinimumCurveNodes
- Minimum number of nodes used to mesh curves other than lines, circles and ellipses
  Default value: 3
  Saved in: General.OptionsFileName

Mesh.MinimumElementsPerTwoPi
- [Deprecated]
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.MshFileVersion
- Version of the MSH file format to use
  Default value: 4.1
  Saved in: General.OptionsFileName

Mesh.MedFileVersion
- Minor version of the MED file format to use (-1: use minor version of the MED library)
  Default value: -1
  Saved in: General.OptionsFileName

Mesh.MedImportGroupsOfNodes
- Import groups of nodes (0: no; 1: create geometrical point for each node)?
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.MedSingleModel
- Import MED meshes in the current model, even if several MED mesh names exist
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.NbHexahedra
- Number of hexahedra in the current mesh (read-only)
  Default value: 0
  Saved in: -

Mesh.NbNodes
- Number of nodes in the current mesh (read-only)
  Default value: 0
  Saved in: -

Mesh.NbPartitions
- Number of partitions
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.NbPrisms
- Number of prisms in the current mesh (read-only)
  Default value: 0
  Saved in: -

Mesh.NbPyramids
- Number of pyramids in the current mesh (read-only)
  Default value: 0
  Saved in: -
Mesh.NbTrihedra
   Number of trihedra in the current mesh (read-only)
   Default value: 0
   Saved in: -

Mesh.NbQuadrangles
   Number of quadrangles in the current mesh (read-only)
   Default value: 0
   Saved in: -

Mesh.NbTetrahedra
   Number of tetrahedra in the current mesh (read-only)
   Default value: 0
   Saved in: -

Mesh.NbTriangles
   Number of triangles in the current mesh (read-only)
   Default value: 0
   Saved in: -

Mesh.NewtonConvergenceTestXYZ
   Force inverse surface mapping algorithm (Newton-Raphson) to converge in real co-
   ordinates (experimental)
   Default value: 0
   Saved in: General.OptionsFileName

Mesh.Nodes
   Display mesh nodes?
   Default value: 0
   Saved in: General.OptionsFileName

Mesh.NodeLabels
   Display mesh node labels?
   Default value: 0
   Saved in: General.OptionsFileName

Mesh.NodeSize
   Display size of mesh nodes (in pixels)
   Default value: 4
   Saved in: General.OptionsFileName

Mesh.NodeType
   Display mesh nodes as solid color dots (0) or 3D spheres (1)
   Default value: 0
   Saved in: General.OptionsFileName

Mesh.Normals
   Display size of normal vectors (in pixels)
   Default value: 0
   Saved in: General.OptionsFileName

Mesh.NumSubEdges
   Number of edge subdivisions used to draw high-order mesh elements
   Default value: 2
   Saved in: General.OptionsFileName
Mesh.OldInitialDelaunay2D
    Use old initial 2D Delaunay code
    Default value: 0
    Saved in: General.OptionsFileName

Mesh.Optimize
    Optimize the mesh to improve the quality of tetrahedral elements
    Default value: 1
    Saved in: General.OptionsFileName

Mesh.OptimizeThreshold
    Optimize tetrahedra that have a quality below ...
    Default value: 0.3
    Saved in: General.OptionsFileName

Mesh.OptimizeNetgen
    Optimize the mesh using Netgen to improve the quality of tetrahedral elements
    Default value: 0
    Saved in: General.OptionsFileName

Mesh.PartitionHexWeight
    Weight of hexahedral element for METIS load balancing (-1: automatic)
    Default value: -1
    Saved in: General.OptionsFileName

Mesh.PartitionLineWeight
    Weight of line element for METIS load balancing (-1: automatic)
    Default value: -1
    Saved in: General.OptionsFileName

Mesh.PartitionPrismWeight
    Weight of prismatic element (wedge) for METIS load balancing (-1: automatic)
    Default value: -1
    Saved in: General.OptionsFileName

Mesh.PartitionPyramidWeight
    Weight of pyramidal element for METIS load balancing (-1: automatic)
    Default value: -1
    Saved in: General.OptionsFileName

Mesh.PartitionQuadWeight
    Weight of quadrangle for METIS load balancing (-1: automatic)
    Default value: -1
    Saved in: General.OptionsFileName

Mesh.PartitionTrihedronWeight
    Weight of trihedron element for METIS load balancing (-1: automatic)
    Default value: 0
    Saved in: General.OptionsFileName

Mesh.PartitionTetWeight
    Weight of tetrahedral element for METIS load balancing (-1: automatic)
    Default value: -1
    Saved in: General.OptionsFileName

Mesh.PartitionTriWeight
    Weight of triangle element for METIS load balancing (-1: automatic)
    Default value: -1
    Saved in: General.OptionsFileName
Mesh.PartitionCreateTopology
  Create boundary representation of partitions
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.PartitionCreatePhysicals
  Create physical groups for partitions, based on existing physical groups
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.PartitionCreateGhostCells
  Create ghost cells, i.e. create for each partition a ghost entity containing elements
  connected to neighboring partitions by at least one node.
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.PartitionSplitMeshFiles
  Write one file for each mesh partition
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.PartitionTopologyFile
  Write a .pro file with the partition topology
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.PartitionOldStyleMsh2
  Write partitioned meshes in MSH2 format using old style (i.e. by not referencing new
  partitioned entities, except on partition boundaries), for backward compatibility
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.PartitionConvertMsh2
  When reading partitioned meshes in MSH2 format, create new partition entities
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.PreserveNumberingMsh2
  Preserve element numbering in MSH2 format (will break meshes with multiple physical
  groups for a single elementary entity)
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.Prism
  Display mesh prisms?
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.Pyramid
  Display mesh pyramids?
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.QuadgsSizemapMethod
  Size map method in QuadQuasiStructured. 0: default, 1: cross-field, 2: cross-field +
  CAD small features adaptation, 3: from background mesh (e.g. sizes in current tri-
  angulation), 4: cross-field + CAD small features adaptation (clamped by background
mesh)
Default value: 3
Saved in: General.OptionsFileName

Mesh.QuadgsTopologyOptimizationMethods
Topology optimization methods in QuadQuasiStructured. 0: default (all), 100: pattern-based CAD faces, 010: disk quadrangulation remeshing, 001: cavity remeshing, xxx: combination of multiple methods (e.g. 111 for all)
Default value: 0
Saved in: General.OptionsFileName

Mesh.QuadgsRemeshingBoldness
Controls how much cavity remeshing is allowed to distort the quad mesh. From 0 (no quality decrease during remeshing) to 1 (quality can tend to 0 during remeshing).
Default value: 0.66
Saved in: General.OptionsFileName

Mesh.QuadgsScalingOnTriangulation
Ratio on the edge length between the triangulation and the quadrangulation. Use a small ratio (e.g. 0.5) to get a background triangulation finer than the quad mesh. Useful to get a more accurate cross-field.
Default value: 0.75
Saved in: General.OptionsFileName

Mesh.Quadrangles
Display mesh quadrangles?
Default value: 1
Saved in: General.OptionsFileName

Mesh.QualityInf
Only display elements whose quality measure is greater than QualityInf
Default value: 0
Saved in: General.OptionsFileName

Mesh.QualitySup
Only display elements whose quality measure is smaller than QualitySup
Default value: 0
Saved in: General.OptionsFileName

Mesh.QualityType
Type of quality measure (0: SICN ~ signed inverse condition number, 1: SIGE ~ signed inverse gradient error, 2: gamma ~ vol/sum_face/max_edge, 3: Disto ~ minJ/maxJ
Default value: 2
Saved in: General.OptionsFileName

Mesh.RadiusInf
Only display elements whose longest edge is greater than RadiusInf
Default value: 0
Saved in: General.OptionsFileName

Mesh.RadiusSup
Only display elements whose longest edge is smaller than RadiusSup
Default value: 0
Saved in: General.OptionsFileName

Mesh.RandomFactor
Random factor used in the 2D meshing algorithm (should be increased if RandomFactor * size(triangle)/size(model) approaches machine accuracy)
Default value: $1e^{-09}$
Saved in: `General.OptionsFileName`

**Mesh.RandomFactor3D**
- Random factor used in the 3D meshing algorithm
- Default value: $1e^{-12}$
- Saved in: `General.OptionsFileName`

**Mesh.RandomSeed**
- Seed of pseudo-random number generator
- Default value: 1
- Saved in: `General.OptionsFileName`

**Mesh.ReadGroupsOfElements**
- Read groups of elements in UNV meshes (this will discard the elementary entity tags inferred from the element section)
- Default value: 1
- Saved in: `General.OptionsFileName`

**Mesh.RecombinationAlgorithm**
- Mesh recombination algorithm (0: simple, 1: blossom, 2: simple full-quad, 3: blossom full-quad)
- Default value: 1
- Saved in: `General.OptionsFileName`

**Mesh.RecombineAll**
- Apply recombination algorithm to all surfaces, ignoring per-surface spec
- Default value: 0
- Saved in: `General.OptionsFileName`

**Mesh.RecombineOptimizeTopology**
- Number of topological optimization passes (removal of diamonds, ...) of recombined surface meshes
- Default value: 5
- Saved in: `General.OptionsFileName`

**Mesh.RecombineNodeRepositioning**
- Allow repositioning of nodes during recombination of surface meshes
- Default value: 1
- Saved in: `General.OptionsFileName`

**Mesh.RecombineMinimumQuality**
- Minimum quality for quadrangle generated by recombination
- Default value: 0.01
- Saved in: `General.OptionsFileName`

**Mesh.Recombine3DAll**
- Apply recombination3D algorithm to all volumes, ignoring per-volume spec (experimental)
- Default value: 0
- Saved in: `General.OptionsFileName`

**Mesh.Recombine3DLevel**
- 3d recombination level (0: hex, 1: hex+prisms, 2: hex+prism+pyramids) (experimental)
- Default value: 0
- Saved in: `General.OptionsFileName`
Mesh.Recombine3DConformity
3d recombination conformity type (0: nonconforming, 1: trihedra, 2: pyra-
mids+trihedra, 3: pyramids+hexSplit+trihedra, 4: hexSplit+trihedra)(experimental)
Default value: 0
Saved in: General.OptionsFileName

Mesh.RefineSteps
Number of refinement steps in the MeshAdapt-based 2D algorithms
Default value: 10
Saved in: General.OptionsFileName

Mesh.Renumber
Renumber nodes and elements in a continuous sequence after mesh generation
Default value: 1
Saved in: General.OptionsFileName

Mesh.ReparamMaxTriangles
Maximum number of triangles in a single parametrization patch
Default value: 250000
Saved in: General.OptionsFileName

Mesh.SaveAll
Save all elements, even if they don’t belong to physical groups (for some mesh
formats, this removes physical groups altogether)
Default value: 0
Saved in: -

Mesh.SaveElementTagType
Type of the element tag saved in mesh formats that don’t support saving physical
or partition ids (1: elementary, 2: physical, 3: partition)
Default value: 1
Saved in: General.OptionsFileName

Mesh.SaveGroupsOfElements
Save groups of elements for each physical group (for UNV and INP mesh format) if
value is positive; if negative, save groups of elements for physical groups of dimension
dim if the (dim+1)^th least significant digit of -Mesh.SaveGroupsOfElements is 1
(for example: -100 will only savesurfaces, while -1010 will save volumes and curves),
and for INP skip saving elements of dimension dim altogether if the (dim+1)^th
least significant digit of -Mesh.SaveGroupsOfElements is 0
Default value: 1
Saved in: General.OptionsFileName

Mesh.SaveGroupsOfNodes
Save groups of nodes for each physical group (for UNV, INP and Tochnog mesh
formats) if value is positive; if negative, save groups of nodes for physical groups of
dimension dim if the (dim+1)^th least significant digit of -Mesh.SaveGroupsOfNodes
is 1 (for example: -100 will only save surfaces, while -1010 will save volumes and
curves): for INP, save groups of nodes for all entities of dimension dim if the
(dim+1)^th least significant digit of -Mesh.SaveGroupsOfNodes is 2
Default value: 0
Saved in: General.OptionsFileName

Mesh.SaveParametric
Save parametric coordinates of nodes
Default value: 0
Saved in: General.OptionsFileName
Mesh.SaveWithoutOrphans
  Don’t save orphan entities (not connected to any highest dimensional entity in the model) in MSH4 files
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.SaveTopology
  Save model topology in MSH2 output files (this is always saved in MSH3 and above)
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.ScalingFactor
  Global scaling factor applied to the saved mesh
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.SecondOrderIncomplete
  Create incomplete second order elements? (8-node quads, 20-node hexas, etc.)
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.SecondOrderLinear
  Should second order nodes (as well as nodes generated with subdivision algorithms) simply be created by linear interpolation?
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.Smoothing
  Number of smoothing steps applied to the final mesh
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.SmoothCrossField
  Apply n barycentric smoothing passes to the 3D cross field
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.CrossFieldClosestPoint
  Use closest point to compute 2D crossfield
  Default value: 1
  Saved in: General.OptionsFileName

Mesh.SmoothNormals
  Smooth the mesh normals?
  Default value: 0
  Saved in: General.OptionsFileName

Mesh.SmoothRatio
  Ratio between mesh sizes at nodes of a same edge (used in BAMG)
  Default value: 1.8
  Saved in: General.OptionsFileName

Mesh.StlAngularDeflection
  Maximum angular deflection when creating STL representations of entities (currently only used with the OpenCASCADE kernel)
  Default value: 0.3
  Saved in: General.OptionsFileName
Mesh.StlLinearDeflection
Maximum relative linear deflection when creating STL representation of entities
(currently only used with the OpenCASCADE kernel)
Default value: 0.001
Saved in: General.OptionsFileName

Mesh.StlLinearDeflectionRelative
Compute the linear deflection for STL representations relative to the length of curves
(currently only used with the OpenCASCADE kernel)
Default value: 1
Saved in: General.OptionsFileName

Mesh.StlOneSolidPerSurface
Create one solid per surface when exporting STL files? (0: single solid, 1: one solid
per face, 2: one solid per physical surface)
Default value: 0
Saved in: General.OptionsFileName

Mesh.StlRemoveDuplicateTriangles
Remove duplicate triangles when importing STL files?
Default value: 0
Saved in: General.OptionsFileName

Mesh.SubdivisionAlgorithm
Mesh subdivision algorithm (0: none, 1: all quadrangles, 2: all hexahedra, 3:
barycentric)
Default value: 0
Saved in: General.OptionsFileName

Mesh.SurfaceEdges
Display edges of surface mesh?
Default value: 1
Saved in: General.OptionsFileName

Mesh.SurfaceFaces
Display faces of surface mesh?
Default value: 0
Saved in: General.OptionsFileName

Mesh.SurfaceLabels
Display surface mesh element labels?
Default value: 0
Saved in: General.OptionsFileName

Mesh.SwitchElementTags
Invert elementary and physical tags when reading the mesh
Default value: 0
Saved in: General.OptionsFileName

Mesh.Tangents
Display size of tangent vectors (in pixels)
Default value: 0
Saved in: General.OptionsFileName

Mesh.Tetrahedra
Display mesh tetrahedra?
Default value: 1
Saved in: General.OptionsFileName
Mesh.ToleranceEdgeLength
Skip a model edge in mesh generation if its length is less than user’s defined tolerance
Default value: 0
Saved in: General.OptionsFileName

Mesh.ToleranceInitialDelaunay
Tolerance for initial 3D Delaunay mesher
Default value: 1e-12
Saved in: General.OptionsFileName

Mesh.ToleranceReferenceElement
Tolerance for classifying a point inside a reference element (of size 1)
Default value: 1e-06
Saved in: General.OptionsFileName

Mesh.Triangles
Display mesh triangles?
Default value: 1
Saved in: General.OptionsFileName

Mesh.Trihedra
Display mesh trihedra?
Default value: 1
Saved in: General.OptionsFileName

Mesh.TransfiniteTri
Use alternative transfinite arrangement when meshing 3-sided surfaces
Default value: 0
Saved in: General.OptionsFileName

Mesh.UnvStrictFormat
Use strict format specification for UNV files, with 'D' for exponents (instead of 'E'
as used by some tools)
Default value: 1
Saved in: General.OptionsFileName

Mesh.VolumeEdges
Display edges of volume mesh?
Default value: 1
Saved in: General.OptionsFileName

Mesh.VolumeFaces
Display faces of volume mesh?
Default value: 0
Saved in: General.OptionsFileName

Mesh.VolumeLabels
Display volume mesh element labels?
Default value: 0
Saved in: General.OptionsFileName

Mesh.Voronoi
Display the voronoi diagram
Default value: 0
Saved in: General.OptionsFileName
Mesh.ZoneDefinition
Method for defining a zone (0: single zone, 1: by partition, 2: by physical)
Default value: 0
Saved in: General.OptionsFileName

Mesh.Color.Nodes
Mesh node color
Default value: {0,0,255}
Saved in: General.OptionsFileName

Mesh.Color.NodesSup
Second order mesh node color
Default value: {255,0,255}
Saved in: General.OptionsFileName

Mesh.Color.Lines
Mesh line color
Default value: {0,0,0}
Saved in: General.OptionsFileName

Mesh.Color.Triangles
Mesh triangle color (if Mesh.ColorCarousel=0)
Default value: {160,150,255}
Saved in: General.OptionsFileName

Mesh.Color.Quadrangles
Mesh quadrangle color (if Mesh.ColorCarousel=0)
Default value: {130,120,225}
Saved in: General.OptionsFileName

Mesh.Color.Tetrahedra
Mesh tetrahedron color (if Mesh.ColorCarousel=0)
Default value: {160,150,255}
Saved in: General.OptionsFileName

Mesh.Color.Hexahedra
Mesh hexahedron color (if Mesh.ColorCarousel=0)
Default value: {130,120,225}
Saved in: General.OptionsFileName

Mesh.Color.Prisms
Mesh prism color (if Mesh.ColorCarousel=0)
Default value: {232,210,23}
Saved in: General.OptionsFileName

Mesh.Color.Pyramids
Mesh pyramid color (if Mesh.ColorCarousel=0)
Default value: {217,113,38}
Saved in: General.OptionsFileName

Mesh.Color.Trihedra
Mesh trihedron color (if Mesh.ColorCarousel=0)
Default value: {20,255,0}
Saved in: General.OptionsFileName

Mesh.Color.Tangents
Tangent mesh vector color
Default value: {255,255,0}
Saved in: General.OptionsFileName
Mesh.Color.Normals
Normal mesh vector color
Default value: {255,0,0}
Saved in: General.OptionsFileName

Mesh.Color.Zero
Color 0 in color carousel
Default value: {255,120,0}
Saved in: General.OptionsFileName

Mesh.Color.One
Color 1 in color carousel
Default value: {0,255,132}
Saved in: General.OptionsFileName

Mesh.Color.Two
Color 2 in color carousel
Default value: {255,160,0}
Saved in: General.OptionsFileName

Mesh.Color.Three
Color 3 in color carousel
Default value: {0,255,192}
Saved in: General.OptionsFileName

Mesh.Color.Four
Color 4 in color carousel
Default value: {255,200,0}
Saved in: General.OptionsFileName

Mesh.Color.Five
Color 5 in color carousel
Default value: {0,216,255}
Saved in: General.OptionsFileName

Mesh.Color.Six
Color 6 in color carousel
Default value: {255,240,0}
Saved in: General.OptionsFileName

Mesh.Color.Seven
Color 7 in color carousel
Default value: {0,176,255}
Saved in: General.OptionsFileName

Mesh.Color.Eight
Color 8 in color carousel
Default value: {228,255,0}
Saved in: General.OptionsFileName

Mesh.Color.Nine
Color 9 in color carousel
Default value: {0,116,255}
Saved in: General.OptionsFileName

Mesh.Color.Ten
Color 10 in color carousel
Default value: {188,255,0}
Saved in: General.OptionsFileName
Mesh.Color.Eleven
  Color 11 in color carousel
  Default value: \{0,76,255\}
  Saved in: General.OptionsFileName

Mesh.Color.Twelve
  Color 12 in color carousel
  Default value: \{148,255,0\}
  Saved in: General.OptionsFileName

Mesh.Color.Thirteen
  Color 13 in color carousel
  Default value: \{24,0,255\}
  Saved in: General.OptionsFileName

Mesh.Color.Fourteen
  Color 14 in color carousel
  Default value: \{108,255,0\}
  Saved in: General.OptionsFileName

Mesh.Color.Fifteen
  Color 15 in color carousel
  Default value: \{84,0,255\}
  Saved in: General.OptionsFileName

Mesh.Color.Sixteen
  Color 16 in color carousel
  Default value: \{68,255,0\}
  Saved in: General.OptionsFileName

Mesh.Color.Seventeen
  Color 17 in color carousel
  Default value: \{104,0,255\}
  Saved in: General.OptionsFileName

Mesh.Color.Eighteen
  Color 18 in color carousel
  Default value: \{0,255,52\}
  Saved in: General.OptionsFileName

Mesh.Color.Nineteen
  Color 19 in color carousel
  Default value: \{184,0,255\}
  Saved in: General.OptionsFileName

7.5 Solver options

Solver.Executable0
  System command to launch solver 0
  Default value: ""
  Saved in: General.SessionFileName

Solver.Executable1
  System command to launch solver 1
  Default value: ""
  Saved in: General.SessionFileName
Solver.Executable2
   System command to launch solver 2
   Default value: ""
   Saved in: General.SessionFileName

Solver.Executable3
   System command to launch solver 3
   Default value: ""
   Saved in: General.SessionFileName

Solver.Executable4
   System command to launch solver 4
   Default value: ""
   Saved in: General.SessionFileName

Solver.Executable5
   System command to launch solver 5
   Default value: ""
   Saved in: General.SessionFileName

Solver.Executable6
   System command to launch solver 6
   Default value: ""
   Saved in: General.SessionFileName

Solver.Executable7
   System command to launch solver 7
   Default value: ""
   Saved in: General.SessionFileName

Solver.Executable8
   System command to launch solver 8
   Default value: ""
   Saved in: General.SessionFileName

Solver.Executable9
   System command to launch solver 9
   Default value: ""
   Saved in: General.SessionFileName

Solver.Name0
   Name of solver 0
   Default value: "GetDP"
   Saved in: General.SessionFileName

Solver.Name1
   Name of solver 1
   Default value: ""
   Saved in: General.SessionFileName

Solver.Name2
   Name of solver 2
   Default value: ""
   Saved in: General.SessionFileName

Solver.Name3
   Name of solver 3
   Default value: ""
   Saved in: General.SessionFileName
Chapter 7: Gmsh options

Solver.Name4
Name of solver 4
Default value: ""
Saved in: General.SessionFileName

Solver.Name5
Name of solver 5
Default value: ""
Saved in: General.SessionFileName

Solver.Name6
Name of solver 6
Default value: ""
Saved in: General.SessionFileName

Solver.Name7
Name of solver 7
Default value: ""
Saved in: General.SessionFileName

Solver.Name8
Name of solver 8
Default value: ""
Saved in: General.SessionFileName

Solver.Name9
Name of solver 9
Default value: ""
Saved in: General.SessionFileName

Solver.Extension0
File extension for solver 0
Default value: ".pro"
Saved in: General.SessionFileName

Solver.Extension1
File extension for solver 1
Default value: ""
Saved in: General.SessionFileName

Solver.Extension2
File extension for solver 2
Default value: ""
Saved in: General.SessionFileName

Solver.Extension3
File extension for solver 3
Default value: ""
Saved in: General.SessionFileName

Solver.Extension4
File extension for solver 4
Default value: ""
Saved in: General.SessionFileName

Solver.Extension5
File extension for solver 5
Default value: ""
Saved in: General.SessionFileName
Solver.Extension6
  File extension for solver 6
  Default value: ""
  Saved in: General.SessionFileName

Solver.Extension7
  File extension for solver 7
  Default value: ""
  Saved in: General.SessionFileName

Solver.Extension8
  File extension for solver 8
  Default value: ""
  Saved in: General.SessionFileName

Solver.Extension9
  File extension for solver 9
  Default value: ""
  Saved in: General.SessionFileName

Solver.OctaveInterpreter
  Name of the Octave interpreter (used to run .m files)
  Default value: "octave"
  Saved in: General.SessionFileName

Solver.PythonInterpreter
  Name of the Python interpreter (used to run .py files if they are not executable)
  Default value: "python"
  Saved in: General.SessionFileName

Solver.RemoteLogin0
  Command to login to a remote host to launch solver 0
  Default value: ""
  Saved in: General.SessionFileName

Solver.RemoteLogin1
  Command to login to a remote host to launch solver 1
  Default value: ""
  Saved in: General.SessionFileName

Solver.RemoteLogin2
  Command to login to a remote host to launch solver 2
  Default value: ""
  Saved in: General.SessionFileName

Solver.RemoteLogin3
  Command to login to a remote host to launch solver 3
  Default value: ""
  Saved in: General.SessionFileName

Solver.RemoteLogin4
  Command to login to a remote host to launch solver 4
  Default value: ""
  Saved in: General.SessionFileName

Solver.RemoteLogin5
  Command to login to a remote host to launch solver 5
  Default value: ""
  Saved in: General.SessionFileName
Chapter 7: Gmsh options

**Solver.RemoteLogin6**
- Command to login to a remote host to launch solver 6
- Default value: 
- Saved in: `General.SessionFileName`

**Solver.RemoteLogin7**
- Command to login to a remote host to launch solver 7
- Default value: 
- Saved in: `General.SessionFileName`

**Solver.RemoteLogin8**
- Command to login to a remote host to launch solver 8
- Default value: 
- Saved in: `General.SessionFileName`

**Solver.RemoteLogin9**
- Command to login to a remote host to launch solver 9
- Default value: 
- Saved in: `General.SessionFileName`

**Solver.SocketName**
- Base name of socket (UNIX socket if the name does not contain a colon, TCP/IP otherwise, in the form 'host:baseport'; the actual name/port is constructed by appending the unique client id. If baseport is 0 or is not provided, the port is chosen automatically (recommended))
- Default value: ".gmshsock"
- Saved in: `General.OptionsFileName`

**Solver.AlwaysListen**
- Always listen to incoming connection requests?
- Default value: 0
- Saved in: `General.OptionsFileName`

**Solver.AutoArchiveOutputFiles**
- Automatically archive output files after each computation
- Default value: 0
- Saved in: `General.OptionsFileName`

**Solver.AutoCheck**
- Automatically check model every time a parameter is changed
- Default value: 1
- Saved in: `General.OptionsFileName`

**Solver.AutoLoadDatabase**
- Automatically load the ONELAB database when launching a solver
- Default value: 0
- Saved in: `General.OptionsFileName`

**Solver.AutoSaveDatabase**
- Automatically save the ONELAB database after each computation
- Default value: 1
- Saved in: `General.OptionsFileName`

**Solver.AutoMesh**
- Automatically mesh (0: never; 1: if geometry changed, but use existing mesh on disk if available; 2: if geometry changed; -1: the geometry script creates the mesh)
- Default value: 2
- Saved in: `General.OptionsFileName`
Solver.AutoMergeFile
Automatically merge result files
Default value: 1
Saved in: General.OptionsFileName

Solver.AutoShowViews
Automatically show newly merged results (0: none; 1: all; 2: last one)
Default value: 2
Saved in: General.OptionsFileName

Solver.AutoShowLastStep
Automatically show the last step in newly merged results, if there are more than 2 steps
Default value: 1
Saved in: General.OptionsFileName

Solver.Plugins
Enable default solver plugins?
Default value: 0
Saved in: General.OptionsFileName

Solver.ShowInvisibleParameters
Show all parameters, even those marked invisible
Default value: 0
Saved in: General.OptionsFileName

Solver.Timeout
Time (in seconds) before closing the socket if no connection is happening
Default value: 5
Saved in: General.OptionsFileName

7.6 Post-processing options

PostProcessing.DoubleClickedGraphPointCommand
Command parsed when double-clicking on a graph data point (e.g. Merge Sprintf('file_%g.pos', PostProcessing.GraphPointX);)
Default value: ""
Saved in: General.OptionsFileName

PostProcessing.GraphPointCommand
Synonym for ‘DoubleClickedGraphPointCommand’
Default value: ""
Saved in: General.OptionsFileName

PostProcessing.AnimationDelay
Delay (in seconds) between frames in automatic animation mode
Default value: 0.1
Saved in: General.OptionsFileName

PostProcessing.AnimationCycle
Cycle through time steps (0) or views (1) for animations
Default value: 0
Saved in: General.OptionsFileName

PostProcessing.AnimationStep
Step increment for animations
Default value: 1
Saved in: General.OptionsFileName
Chapter 7: Gmsh options

PostProcessing.Binary
Write post-processing files in binary format (if possible)
Default value: 0
Saved in: General.OptionsFileName

PostProcessing.CombineRemoveOriginal
Remove original views after a Combine operation
Default value: 1
Saved in: General.OptionsFileName

PostProcessing.CombineCopyOptions
Copy options during Combine operation
Default value: 1
Saved in: General.OptionsFileName

PostProcessing.DoubleClickedGraphPointX
Abscissa of last double-clicked graph point
Default value: 0
Saved in: -

PostProcessing.DoubleClickedGraphPointY
Ordinate of last double-clicked graph point
Default value: 0
Saved in: -

PostProcessing.DoubleClickedView
Index of last double-clicked view
Default value: 0
Saved in: -

PostProcessing.ForceElementData
Try to force saving datasets as ElementData
Default value: 0
Saved in: General.OptionsFileName

PostProcessing.ForceNodeData
Try to force saving datasets as NodeData
Default value: 0
Saved in: General.OptionsFileName

PostProcessing.Format
Default file format for post-processing views (0: ASCII view, 1: binary view, 2: parsed view, 3: STL triangulation, 4: raw text, 5: Gmsh mesh, 6: MED file, 10: automatic)
Default value: 10
Saved in: General.OptionsFileName

PostProcessing.GraphPointX
Synonym for ‘DoubleClickedGraphPointX’
Default value: 0
Saved in: -

PostProcessing.GraphPointY
Synonym for ‘DoubleClickedGraphPointY’
Default value: 0
Saved in: -
PostProcessing.HorizontalScales
  Display value scales horizontally
  Default value: 1
  Saved in: General.OptionsFileName

PostProcessing.Link
  Post-processing view links (0: apply next option changes to selected views, 1: force
  same options for all selected views)
  Default value: 0
  Saved in: General.OptionsFileName

PostProcessing.NbViews
  Current number of views merged (read-only)
  Default value: 0
  Saved in: -

PostProcessing.Plugins
  Enable default post-processing plugins?
  Default value: 1
  Saved in: General.Options.FileName

PostProcessing.SaveInterpolationMatrices
  Save the interpolation matrices when exporting model-based data
  Default value: 1
  Saved in: General.Options.FileName

PostProcessing.SaveMesh
  Save the mesh when exporting model-based data
  Default value: 1
  Saved in: General.Options.FileName

PostProcessing.Smoothing
  Apply (non-reversible) smoothing to post-processing view when merged
  Default value: 0
  Saved in: General.Options.FileName

### 7.7 Post-processing view options

Options related to post-processing views take two forms.

1. options that should apply to all views can be set through ‘View.string’, *before any view
   is loaded*;
2. options that should apply only to the *n*-th view take the form ‘View[n].string’ (*n* = 0,
   1, 2, . . .), *after the *n*-th view is loaded*.

View.Attributes
  Optional string attached to the view. If the string contains 'AlwaysVisible', the
  view will not be hidden when new ones are merged.
  Default value: ""
  Saved in: General.Options.FileName

View.AxesFormatX
  Number format for X-axis (in standard C form)
  Default value: "%3g"
  Saved in: General.Options.FileName
Chapter 7: Gmsh options

View.AxesFormatY
Number format for Y-axis (in standard C form)
Default value: "%.3g"
Saved in: General.OptionsFileName

View.AxesFormatZ
Number format for Z-axis (in standard C form)
Default value: "%.3g"
Saved in: General.OptionsFileName

View.AxesLabelX
X-axis label
Default value: ""
Saved in: General.OptionsFileName

View.AxesLabelY
Y-axis label
Default value: ""
Saved in: General.OptionsFileName

View.AxesLabelZ
Z-axis label
Default value: ""
Saved in: General.OptionsFileName

View.DoubleClickedCommand
Command parsed when double-clicking on the view
Default value: ""
Saved in: General.OptionsFileName

View.FileName
Default post-processing view file name
Default value: ""
Saved in: -

View.Format
Number format (in standard C form)
Default value: "%.3g"
Saved in: General.OptionsFileName

View.GeneralizedRaiseX
Generalized elevation of the view along X-axis (in model coordinates, using formula possibly containing x, y, z, s[tep], t[ime], v0, ... v8)
Default value: "v0"
Saved in: General.OptionsFileName

View.GeneralizedRaiseY
Generalized elevation of the view along Y-axis (in model coordinates, using formula possibly containing x, y, z, s[tep], t[ime], v0, ... v8)
Default value: "v1"
Saved in: General.OptionsFileName

View.GeneralizedRaiseZ
Generalized elevation of the view along Z-axis (in model coordinates, using formula possibly containing x, y, z, s[tep], t[ime], v0, ... v8)
Default value: "v2"
Saved in: General.OptionsFileName
View.Group
Group to which this view belongs
Default value: ""
Saved in: General.OptionsFileName

View.Name
Default post-processing view name
Default value: ""
Saved in: -

View.Stipple0
First stippling pattern
Default value: "1*0x1F1F"
Saved in: General.OptionsFileName

View.Stipple1
Second stippling pattern
Default value: "1*0x3333"
Saved in: General.OptionsFileName

View.Stipple2
Third stippling pattern
Default value: "1*0x087F"
Saved in: General.OptionsFileName

View.Stipple3
Fourth stippling pattern
Default value: "1*0xCFFF"
Saved in: General.OptionsFileName

View.Stipple4
Fifth stippling pattern
Default value: "2*0x1111"
Saved in: General.OptionsFileName

View.Stipple5
Sixth stippling pattern
Default value: "2*0x0F0F"
Saved in: General.OptionsFileName

View.Stipple6
Seventh stippling pattern
Default value: "1*0xFFFE"
Saved in: General.OptionsFileName

View.Stipple7
Eighth stippling pattern
Default value: "2*0x0202"
Saved in: General.OptionsFileName

View.Stipple8
Ninth stippling pattern
Default value: "2*0x087F"
Saved in: General.OptionsFileName

View.Stipple9
Tenth stippling pattern
Default value: "1*0xFFFF"
Saved in: General.OptionsFileName
Chapter 7: Gmsh options

View.AbscissaRangeType
Ascissa scale range type (1: default, 2: custom)
Default value: 1
Saved in: General.OptionsFileName

View.AdaptVisualizationGrid
Use adaptive visualization grid (for high-order elements)?
Default value: 0
Saved in: General.OptionsFileName

View.AngleSmoothNormals
Threshold angle below which normals are not smoothed
Default value: 30
Saved in: General.OptionsFileName

View.ArrowSizeMax
Maximum display size of arrows (in pixels)
Default value: 60
Saved in: General.OptionsFileName

View.ArrowSizeMin
Minimum display size of arrows (in pixels)
Default value: 0
Saved in: General.OptionsFileName

View.AutoPosition
Position the scale or 2D plot automatically (0: manual, 1: automatic, 2: top left, 3: top right, 4: bottom left, 5: bottom right, 6: top, 7: bottom, 8: left, 9: right, 10: full, 11: top third, 12: in model coordinates)
Default value: 1
Saved in: General.OptionsFileName

View.Axes
Axes (0: none, 1: simple axes, 2: box, 3: full grid, 4: open grid, 5: ruler)
Default value: 0
Saved in: General.OptionsFileName

View.AxesMikado
Mikado axes style
Default value: 0
Saved in: General.OptionsFileName

View.AxesAutoPosition
Position the axes automatically
Default value: 1
Saved in: General.OptionsFileName

View.AxesMaxX
Maximum X-axis coordinate
Default value: 1
Saved in: General.OptionsFileName

View.AxesMaxY
Maximum Y-axis coordinate
Default value: 1
Saved in: General.OptionsFileName
**View.AxesMaxZ**
- Maximum Z-axis coordinate
- Default value: 1
- Saved in: General.OptionsFileName

**View.AxesMinX**
- Minimum X-axis coordinate
- Default value: 0
- Saved in: General.OptionsFileName

**View.AxesMinY**
- Minimum Y-axis coordinate
- Default value: 0
- Saved in: General.OptionsFileName

**View.AxesMinZ**
- Minimum Z-axis coordinate
- Default value: 0
- Saved in: General.OptionsFileName

**View.AxesTicsX**
- Number of tics on the X-axis
- Default value: 5
- Saved in: General.OptionsFileName

**View.AxesTicsY**
- Number of tics on the Y-axis
- Default value: 5
- Saved in: General.OptionsFileName

**View.AxesTicsZ**
- Number of tics on the Z-axis
- Default value: 5
- Saved in: General.OptionsFileName

**View.Boundary**
- Draw the ‘N minus b’-dimensional boundary of the element (N: element dimension, b: option value)
- Default value: 0
- Saved in: General.OptionsFileName

**View.CenterGlyphs**
- Center glyphs (arrows, numbers, etc.)? (0: left, 1: centered, 2: right)
- Default value: 0
- Saved in: General.OptionsFileName

**View.Chip**
- Enable clipping planes? (Plane[i]=2^i, i=0,...,5)
- Default value: 0
- Saved in: -

**View.Closed**
- Close the subtree containing this view
- Default value: 0
- Saved in: General.OptionsFileName
Chapter 7: Gmsh options

View.ColormapAlpha
   Colormap alpha channel value (used only if != 1)
   Default value: 1
   Saved in: General.OptionsFileName

View.ColormapAlphaPower
   Colormap alpha channel power
   Default value: 0
   Saved in: General.OptionsFileName

View.ColormapBeta
   Colormap beta parameter (gamma = 1-beta)
   Default value: 0
   Saved in: General.OptionsFileName

View.ColormapBias
   Colormap bias
   Default value: 0
   Saved in: General.OptionsFileName

View.ColormapCurvature
   Colormap curvature or slope coefficient
   Default value: 0
   Saved in: General.OptionsFileName

View.ColormapInvert
   Invert the color values, i.e., replace x with (255-x) in the colormap?
   Default value: 0
   Saved in: General.OptionsFileName

View.ColormapNumber
   Default value: 2
   Saved in: General.OptionsFileName

View.ColormapRotation
   Incremental colormap rotation
   Default value: 0
   Saved in: General.OptionsFileName

View.ColormapSwap
   Swap the min/max values in the colormap?
   Default value: 0
   Saved in: General.OptionsFileName

View.ComponentMap0
   Forced component 0 (if View.ForceNumComponents > 0)
   Default value: 0
   Saved in: General.OptionsFileName

View.ComponentMap1
   Forced component 1 (if View.ForceNumComponents > 0)
   Default value: 1
   Saved in: General.OptionsFileName
View.ComponentMap2
  Forced component 2 (if View.ForceNumComponents > 0)
  Default value: 2
  Saved in: General.OptionsFileName

View.ComponentMap3
  Forced component 3 (if View.ForceNumComponents > 0)
  Default value: 3
  Saved in: General.OptionsFileName

View.ComponentMap4
  Forced component 4 (if View.ForceNumComponents > 0)
  Default value: 4
  Saved in: General.OptionsFileName

View.ComponentMap5
  Forced component 5 (if View.ForceNumComponents > 0)
  Default value: 5
  Saved in: General.OptionsFileName

View.ComponentMap6
  Forced component 6 (if View.ForceNumComponents > 0)
  Default value: 6
  Saved in: General.OptionsFileName

View.ComponentMap7
  Forced component 7 (if View.ForceNumComponents > 0)
  Default value: 7
  Saved in: General.OptionsFileName

View.ComponentMap8
  Forced component 8 (if View.ForceNumComponents > 0)
  Default value: 8
  Saved in: General.OptionsFileName

View.CustomAbscissaMax
  User-defined maximum abscissa value
  Default value: 0
  Saved in: -

View.CustomAbscissaMin
  User-defined minimum abscissa value
  Default value: 0
  Saved in: -

View.CustomMax
  User-defined maximum value to be displayed
  Default value: 0
  Saved in: -

View.CustomMin
  User-defined minimum value to be displayed
  Default value: 0
  Saved in: -

View.DisplacementFactor
  Displacement amplification
  Default value: 1
  Saved in: General.OptionsFileName
Chapter 7: Gmsh options

**View.DrawHexahedra**
Display post-processing hexahedra?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawLines**
Display post-processing lines?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawPoints**
Display post-processing points?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawPrisms**
Display post-processing prisms?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawPyramids**
Display post-processing pyramids?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawTetrahedra**
Display post-processing tetrahedra?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawTetrahedra**
Display post-processing trihedra?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawQuadrangles**
Display post-processing quadrangles?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawScalars**
Display scalar values?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawSkinOnly**
Draw only the skin of 3D scalar views?
Default value: 0
Saved in: General.OptionsFileName

**View.DrawStrings**
Display post-processing annotation strings?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawLines**
Display post-processing lines?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawPoints**
Display post-processing points?
Default value: 1
Saved in: General.OptionsFileName

**View.DrawTetrahedra**
Display post-processing tetrahedra?
Default value: 1
Saved in: General.OptionsFileName
View.DrawTriangles
   Display post-processing triangles?
   Default value: 1
   Saved in: General.OptionsFileName

View.DrawVectors
   Display vector values?
   Default value: 1
   Saved in: General.OptionsFileName

View.Explode
   Element shrinking factor (between 0 and 1)
   Default value: 1
   Saved in: General.OptionsFileName

View.ExternalView
   Index of the view used to color vector fields (-1: self)
   Default value: -1
   Saved in: General.OptionsFileName

View.FakeTransparency
   Use fake transparency (cheaper than the real thing, but incorrect)
   Default value: 0
   Saved in: General.OptionsFileName

View.ForceNumComponents
   Force number of components to display (see View.ComponentMapN for mapping)
   Default value: 0
   Saved in: General.OptionsFileName

View.GeneralizedRaiseFactor
   Generalized raise amplification factor
   Default value: 1
   Saved in: General.OptionsFileName

View.GeneralizedRaiseView
   Index of the view used for generalized raise (-1: self)
   Default value: -1
   Saved in: General.OptionsFileName

View.GlyphLocation
   Glyph (arrow, number, etc.) location (1: center of gravity, 2: node)
   Default value: 1
   Saved in: General.OptionsFileName

View.Height
   Height (in pixels) of the scale or 2D plot
   Default value: 200
   Saved in: General.OptionsFileName

View.IntervalsType
   Type of interval display (1: iso, 2: continuous, 3: discrete, 4: numeric)
   Default value: 2
   Saved in: General.OptionsFileName

View.Light
   Enable lighting for the view
   Default value: 1
   Saved in: General.OptionsFileName
View.LightLines
- Light element edges
- Default value: 1
- Saved in: General.OptionsFileName

View.LightTwoSide
- Light both sides of surfaces (leads to slower rendering)
- Default value: 1
- Saved in: General.OptionsFileName

View.LineType
- Display lines as solid color segments (0), 3D cylinders (1) or tapered cylinders (2)
- Default value: 0
- Saved in: General.OptionsFileName

View.LineWidth
- Display width of lines (in pixels)
- Default value: 1
- Saved in: General.OptionsFileName

View.MaxRecursionLevel
- Maximum recursion level for adaptive views
- Default value: 0
- Saved in: General.OptionsFileName

View.Max
- Maximum value in the view (read-only)
- Default value: 0
- Saved in: -

View.MaxVisible
- Maximum value in the visible parts of the view, taking current time step and tensor display type into account (read-only)
- Default value: 0
- Saved in: -

View.MaxX
- Maximum view coordinate along the X-axis (read-only)
- Default value: 0
- Saved in: -

View.MaxY
- Maximum view coordinate along the Y-axis (read-only)
- Default value: 0
- Saved in: -

View.MaxZ
- Maximum view coordinate along the Z-axis (read-only)
- Default value: 0
- Saved in: -

View.Min
- Minimum value in the view (read-only)
- Default value: 0
- Saved in: -

View.MinVisible
- Minimum value in the visible parts of the view, taking current time step and tensor display type into account (read-only)
- Default value: 0
- Saved in: -
View.MinX
Minimum view coordinate along the X-axis (read-only)
Default value: 0
Saved in: -

View.MinY
Minimum view coordinate along the Y-axis (read-only)
Default value: 0
Saved in: -

View.MinZ
Minimum view coordinate along the Z-axis (read-only)
Default value: 0
Saved in: -

View.NbIso
Number of intervals
Default value: 10
Saved in: General.OptionsFileName

View.NbTimeStep
Number of time steps in the view (do not change this!)
Default value: 1
Saved in: -

View.NormalRaise
Elevation of the view along the normal (in model coordinates)
Default value: 0
Saved in: -

ViewNormals
Display size of normal vectors (in pixels)
Default value: 0
Saved in: General.OptionsFileName

View.OffsetX
Translation of the view along X-axis (in model coordinates)
Default value: 0
Saved in: -

View.OffsetY
Translation of the view along Y-axis (in model coordinates)
Default value: 0
Saved in: -

View.OffsetZ
Translation of the view along Z-axis (in model coordinates)
Default value: 0
Saved in: -

View.PointSize
Display size of points (in pixels)
Default value: 3
Saved in: General.OptionsFileName

View.PointType
Display points as solid color dots (0), 3D spheres (1), scaled dots (2) or scaled spheres (3)
Chapter 7: Gmsh options

Default value: 0
Saved in: `General.OptionsFileName`

**View.PositionX**
X position (in pixels) of the scale or 2D plot (\(< 0\): measure from right edge; \(>= 1e5\): centered)
Default value: 100
Saved in: `General.OptionsFileName`

**View.PositionY**
Y position (in pixels) of the scale or 2D plot (\(< 0\): measure from bottom edge; \(>= 1e5\): centered)
Default value: 50
Saved in: `General.OptionsFileName`

**View.RaiseX**
Elevation of the view along X-axis (in model coordinates)
Default value: 0
Saved in: `-`

**View.RaiseY**
Elevation of the view along Y-axis (in model coordinates)
Default value: 0
Saved in: `-`

**View.RaiseZ**
Elevation of the view along Z-axis (in model coordinates)
Default value: 0
Saved in: `-`

**View.RangeType**
Value scale range type (1: default, 2: custom, 3: per time step)
Default value: 1
Saved in: `General.OptionsFileName`

**View.Sampling**
Element sampling rate (draw one out every ‘Sampling’ elements)
Default value: 1
Saved in: `General.OptionsFileName`

**View.SaturateValues**
Saturate the view values to custom min and max (1: true, 0: false)
Default value: 0
Saved in: `General.OptionsFileName`

**View.ScaleType**
Value scale type (1: linear, 2: logarithmic, 3: double logarithmic)
Default value: 1
Saved in: `General.OptionsFileName`

**View.ShowElement**
Show element boundaries?
Default value: 0
Saved in: `General.OptionsFileName`

**View.ShowScale**
Show value scale?
Default value: 1
Saved in: `General.OptionsFileName`
View.ShowTime
Time display mode (0: none, 1: time series, 2: harmonic data, 3: automatic, 4: step data, 5: multi-step data, 6: real eigenvalues, 7: complex eigenvalues)
Default value: 3
Saved in: General.OptionsFileName

View.SmoothNormals
Smooth the normals?
Default value: 0
Saved in: General.OptionsFileName

View.Stipple
Stipple curves in 2D and line plots?
Default value: 0
Saved in: General.OptionsFileName

View.Tangents
Display size of tangent vectors (in pixels)
Default value: 0
Saved in: General.OptionsFileName

View.TargetError
Target representation error for adaptive views
Default value: 0.0001
Saved in: General.OptionsFileName

View.TensorType
Tensor display type (1: Von-Mises, 2: maximum eigenvalue, 3: minimum eigenvalue, 4: eigenvectors, 5: ellipse, 6: ellipsoid, 7: frame (box), 8: frame (vectors))
Default value: 1
Saved in: General.OptionsFileName

View.TimeStep
Current time step displayed
Default value: 0
Saved in: -

View.Time
Current time displayed (if positive, sets the time step corresponding the given time value)
Default value: 0
Saved in: -

View.TransformXX
Element (1,1) of the 3x3 coordinate transformation matrix
Default value: 1
Saved in: -

View.TransformXY
Element (1,2) of the 3x3 coordinate transformation matrix
Default value: 0
Saved in: -

View.TransformXZ
Element (1,3) of the 3x3 coordinate transformation matrix
Default value: 0
Saved in: -
View.TransformYX
Element (2,1) of the 3x3 coordinate transformation matrix
Default value: 0
Saved in: -

View.TransformYY
Element (2,2) of the 3x3 coordinate transformation matrix
Default value: 1
Saved in: -

View.TransformYZ
Element (2,3) of the 3x3 coordinate transformation matrix
Default value: 0
Saved in: -

View.TransformZX
Element (3,1) of the 3x3 coordinate transformation matrix
Default value: 0
Saved in: -

View.TransformZY
Element (3,2) of the 3x3 coordinate transformation matrix
Default value: 0
Saved in: -

View.TransformZZ
Element (3,3) of the 3x3 coordinate transformation matrix
Default value: 1
Saved in: -

View.Type
Type of plot (1: 3D, 2: 2D space, 3: 2D time, 4: 2D)
Default value: 1
Saved in: -

View.UseGeneralizedRaise
Use generalized raise?
Default value: 0
Saved in: General.OptionsFileName

View.VectorType
Vector display type (1: segment, 2: arrow, 3: pyramid, 4: 3D arrow, 5: displacement, 6: comet)
Default value: 4
Saved in: General.OptionsFileName

View.Visible
Is the view visible?
Default value: 1
Saved in: -

View.Width
Width (in pixels) of the scale or 2D plot
Default value: 300
Saved in: General.OptionsFileName
View.Color.Points
  Point color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Lines
  Line color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Triangles
  Triangle color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Quadrangles
  Quadrangle color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Tetrahedra
  Tetrahedron color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Hexahedra
  Hexahedron color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Prisms
  Prism color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Pyramids
  Pyramid color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Trihedra
  Trihedron color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName

View.Color.Tangents
  Tangent vector color
  Default value: \{255,255,0\}
  Saved in: General.OptionsFileName

View.Color.Normals
  Normal vector color
  Default value: \{255,0,0\}
  Saved in: General.OptionsFileName

View.Color.Text2D
  2D text color
  Default value: \{0,0,0\}
  Saved in: General.OptionsFileName
Chapter 7: Gmsh options

**View.Color.Text3D**
3D text color
Default value: {0,0,0}
Saved in: General.OptionsFileName

**View.Color.Axes**
Axes color
Default value: {0,0,0}
Saved in: General.OptionsFileName

**View.Color.Background2D**
Background color for 2D plots
Default value: {255,255,255}
Saved in: General.OptionsFileName

**View.ColorTable**
Color table used to draw the view
Saved in: General.OptionsFileName
8 Gmsh mesh size fields

This chapter lists all the Gmsh mesh size fields (see Section 1.2.2 [Specifying mesh element sizes], page 10). Fields can be specified in script files (see Section 5.3.1 [Mesh element sizes], page 113) or using the API (see Section 6.5 [Namespace gmsh/model/mesh/field], page 170). See Section 2.10 [t10], page 38 for an example on how to use fields.

**AttractorAnisoCurve**

Compute the distance to the given curves and specify the mesh size independently in the direction normal and parallel to the nearest curve. For efficiency each curve is replaced by a set of Sampling points, to which the distance is actually computed.

Options:

**CurvesList**
Tags of curves in the geometric model
Type: list
Default value: {}

**DistMax**
Maximum distance, above this distance from the curves, prescribe the maximum mesh sizes
Type: float
Default value: 0.5

**DistMin**
Minimum distance, below this distance from the curves, prescribe the minimum mesh sizes
Type: float
Default value: 0.1

**Sampling**
Number of sampling points on each curve
Type: integer
Default value: 20

**SizeMaxNormal**
Maximum mesh size in the direction normal to the closest curve
Type: float
Default value: 0.5

**SizeMaxTangent**
Maximum mesh size in the direction tangent to the closest curve
Type: float
Default value: 0.5

**SizeMinNormal**
Minimum mesh size in the direction normal to the closest curve
Type: float
Default value: 0.05

**SizeMinTangent**
Minimum mesh size in the direction tangent to the closest curve
Type: float
Default value: 0.5

**AutomaticMeshSizeField**
Compute a mesh size field that is quite automatic. Takes into account surface curvatures and closeness of objects.
Options:

**features**  
Enable computation of local feature size (thin channels)  
Type: boolean  
Default value: 1

**gradation**  
Maximum growth ratio for the edges lengths  
Type: float  
Default value: 1.1

**hBulk**  
Default size where it is not prescribed  
Type: float  
Default value: -1

**hMax**  
Maximum size  
Type: float  
Default value: -1

**hMin**  
Minimum size  
Type: float  
Default value: -1

**nPointsPerCircle**  
Number of points per circle (adapt to curvature of surfaces)  
Type: integer  
Default value: 20

**nPointsPerGap**  
Number of layers of elements in thin layers  
Type: integer  
Default value: 0

**p4estFileToLoad**  
p4est file containing the size field  
Type: string  
Default value: ""

**smoothing**  
Enable size smoothing (should always be true)  
Type: boolean  
Default value: 1

**Ball**  
Return VIn inside a spherical ball, and VOut outside. The ball is defined by

\[ ||dX||^2 < R^2 \land \]
\[ dX = (X - XC)^2 + (Y - YC)^2 + (Z - ZC)^2 \]

If Thickness is > 0, the mesh size is interpolated between VIn and VOut in a layer around the ball of the prescribed thickness.

Options:

**Radius**  
Radius  
Type: float  
Default value: 0
**Thickness**
Thickness of a transition layer outside the ball
Type: float
Default value: 0

**VIn**
Value inside the ball
Type: float
Default value: 1e+22

**VOut**
Value outside the ball
Type: float
Default value: 1e+22

**XCenter**
X coordinate of the ball center
Type: float
Default value: 0

**YCenter**
Y coordinate of the ball center
Type: float
Default value: 0

**ZCenter**
Z coordinate of the ball center
Type: float
Default value: 0

**BoundaryLayer**
Insert a 2D boundary layer mesh next to some curves in the model.

Options:

**AnisoMax**
Threshold angle for creating a mesh fan in the boundary layer
Type: float
Default value: 10000000000

**Beta**
Beta coefficient of the Beta Law
Type: float
Default value: 1.01

**BetaLaw**
Use Beta Law instead of geometric progression
Type: integer
Default value: 0

**CurvesList**
Tags of curves in the geometric model for which a boundary layer is needed
Type: list
Default value: {}

**ExcludedSurfacesList**
Tags of surfaces in the geometric model where the boundary layer should not be constructed
Type: list
Default value: {}

**FanPointsList**
Tags of points in the geometric model for which a fan is created
Type: list
Default value: {}/
FanPointsSizesList
Number of elements in the fan for each fan node. If not present default value Mesh.BoundaryLayerFanElements
Type: list
Default value: {}

IntersectMetrics
Intersect metrics of all surfaces
Type: integer
Default value: 0

NbLayers
Number of Layers in the Beta Law
Type: integer
Default value: 10

PointsList
Tags of points in the geometric model for which a boundary layer ends
Type: list
Default value: {}

Quads
Generate recombined elements in the boundary layer
Type: integer
Default value: 0

Ratio
Size ratio between two successive layers
Type: float
Default value: 1.1

Size
Mesh size normal to the curve
Type: float
Default value: 0.1

SizeFar
Mesh size far from the curves
Type: float
Default value: 1

SizesList
Mesh size normal to the curve, per point (overwrites Size when defined)
Type: list_double
Default value: {}

Thickness
Maximal thickness of the boundary layer
Type: float
Default value: 0.01

Box
Return VIn inside the box, and VOut outside. The box is defined by

\[ \begin{align*}
X_{min} & \leq x \leq X_{max} \\
Y_{min} & \leq y \leq Y_{max} \\
Z_{min} & \leq z \leq Z_{max}
\end{align*} \]

If Thickness is > 0, the mesh size is interpolated between VIn and VOut in a layer around the box of the prescribed thickness.

Options:
**Thickness**

Thickness of a transition layer outside the box  
Type: float  
Default value: 0

**VIn**

Value inside the box  
Type: float  
Default value: $1e+22$

**VOut**

Value outside the box  
Type: float  
Default value: $1e+22$

**XMax**

Maximum X coordinate of the box  
Type: float  
Default value: 0

**XMin**

Minimum X coordinate of the box  
Type: float  
Default value: 0

**YMax**

Maximum Y coordinate of the box  
Type: float  
Default value: 0

**YMin**

Minimum Y coordinate of the box  
Type: float  
Default value: 0

**ZMax**

Maximum Z coordinate of the box  
Type: float  
Default value: 0

**ZMin**

Minimum Z coordinate of the box  
Type: float  
Default value: 0

**Constant**

Return VIn when inside the entities (and on their boundary if IncludeBoundary is set), and VOut outside.

**Options:**

**CurvesList**

Curve tags  
Type: list  
Default value: {}

**IncludeBoundary**

Include the boundary of the entities  
Type: boolean  
Default value: 1

**PointsList**

Point tags  
Type: list  
Default value: {}
**SurfacesList**  
Surface tags  
Type: list  
Default value: `{}`

**VIn**  
Value inside the entities  
Type: float  
Default value: `1e+22`

**VOut**  
Value outside the entities  
Type: float  
Default value: `1e+22`

**VolumesList**  
Volume tags  
Type: list  
Default value: `{}`

**Curvature**  
Compute the curvature of `Field[InField]`:  

\[ F = \text{div}(\text{norm}(\text{grad}(\text{Field}[\text{InField}]))) \]

Options:

**Delta**  
Step of the finite differences  
Type: float  
Default value: `0.000346410161513755`

**InField**  
Input field tag  
Type: integer  
Default value: `1`

**Cylinder**  
Return VIn inside a frustrated cylinder, and VOut outside. The cylinder is defined by

\[
||dX||^2 < R^2 &\& \\
(X-X0).A < ||A||^2 \\
dX = (X - X0) - ((X - X0).A)/(||A||^2) \cdot A
\]

Options:

**Radius**  
Radius  
Type: float  
Default value: `0`

**VIn**  
Value inside the cylinder  
Type: float  
Default value: `1e+22`

**VOut**  
Value outside the cylinder  
Type: float  
Default value: `1e+22`

**XAxis**  
X component of the cylinder axis  
Type: float  
Default value: `0`
**XCenter**  X coordinate of the cylinder center  
Type: float  
Default value: 0  

**YAxis**  Y component of the cylinder axis  
Type: float  
Default value: 0  

**YCenter**  Y coordinate of the cylinder center  
Type: float  
Default value: 0  

**ZAxis**  Z component of the cylinder axis  
Type: float  
Default value: 1  

**ZCenter**  Z coordinate of the cylinder center  
Type: float  
Default value: 0  

**Distance**  Compute the distance to the given points, curves or surfaces. For efficiency, curves and surfaces are replaced by a set of points (sampled according to Sampling), to which the distance is actually computed.

Options:

**CurvesList**  Tags of curves in the geometric model  
Type: list  
Default value: {}

**PointsList**  Tags of points in the geometric model  
Type: list  
Default value: {}

**Sampling**  Linear (i.e. per dimension) number of sampling points to discretize each curve and surface  
Type: integer  
Default value: 20

**SurfacesList**  Tags of surfaces in the geometric model (only OpenCASCADE and discrete surfaces are currently supported)  
Type: list  
Default value: {}

**Extend**  Compute an extension of the mesh sizes from the given boundary curves (resp. surfaces) inside the surfaces (resp. volumes) being meshed. If the mesh size on the boundary, computed as the local average length of the edges of the boundary elements, is denoted by SizeBnd, the extension is computed as:

\[
F = f \times \text{SizeBnd} + (1 - f) \times \text{SizeMax}, \text{ if } d < \text{DistMax}
\]

\[
F = \text{SizeMax}, \text{ if } d \geq \text{DistMax}
\]
where d denotes the distance to the boundary and f = ((DistMax - d) / DistMax)^Power.

Options:

**CurvesList**
Tags of curves in the geometric model
Type: list
Default value: {}  

**DistMax**
Maximum distance of the size extension
Type: float
Default value: 1  

**Power**
Power exponent used to interpolate the mesh size
Type: float
Default value: 1  

**SizeMax**
Mesh size outside DistMax
Type: float
Default value: 1  

**SurfacesList**
Tags of surfaces in the geometric model
Type: list
Default value: {}  

**ExternalProcess**
**This Field is experimental**
Call an external process that received coordinates triple (x,y,z) as binary double precision numbers on stdin and is supposed to write the field value on stdout as a binary double precision number. NaN,NaN,NaN is sent as coordinate to indicate the end of the process.

Example of client (python2):
```python
import os
import struct
import math
import sys
if sys.platform == "win32":
    import msvcrt
    msvcrt.setmode(0, os.O_BINARY)
    msvcrt.setmode(1, os.O_BINARY)
while(True):
    xyz = struct.unpack("ddd", os.read(0,24))
    if math.isnan(xyz[0]):
        break
    f = 0.001 + xyz[1]*0.009
    os.write(1,struct.pack("d",f))
```

Example of client (python3):
```python
import struct
import sys
import math
```
while(True):
    xyz = struct.unpack("ddd", sys.stdin.buffer.read(24))
    if math.isnan(xyz[0]):
        break
    f = 0.001 + xyz[1]*0.009
    sys.stdout.buffer.write(struct.pack("d",f))
    sys.stdout.flush()

Example of client (c, unix):
#include <unistd.h>
int main(int argc, char **argv) {
    double xyz[3];
    while(read(STDIN_FILENO, &xyz, 3*sizeof(double)) == 3*sizeof(double)) {
        if (xyz[0] != xyz[0]) break; //nan
        double f = 0.001 + 0.009 * xyz[1];
        write(STDOUT_FILENO, &f, sizeof(double));
    }
    return 0;
}

Example of client (c, windows):
#include <stdio.h>
#include <io.h>
#include <fcntl.h>
int main(int argc, char **argv) {
    double xyz[3];
    setmode(fileno(stdin),O_BINARY);
    setmode(fileno(stdout),O_BINARY);
    while(read(fileno(stdin), &xyz, 3*sizeof(double)) == 3*sizeof(double)) {
        if (xyz[0] != xyz[0]) break;
        double f = 0.01 + 0.09 * xyz[1];
        write(fileno(stdout), &f, sizeof(double));
    }
}

Options:

**CommandLine**
Command line to launch
Type: string
Default value: ""

**Frustum**
Interpolate mesh sizes on a extended cylinder frustrum defined by inner (R1i and R2i) and outer (R1o and R2o) radii and two endpoints P1 and P2. The field value F for a point P is given by:

\[
\begin{align*}
    u &= P1P \cdot P1P2 / ||P1P2|| \\
    r &= ||P1P - u*P1P2|| \\
    Ri &= (1 - u) * R1i + u * R2i \\
    Ro &= (1 - u) * R1o + u * R2o
\end{align*}
\]
\[ v = \frac{(r - Ri)}{(Ro - Ri)} \]
\[ F = (1 - v) * ((1 - u) * v1i + u * v2i) + v * ((1 - u) * v1o + u * v2o) \]
with \((u, v)\) in \([0, 1] \times [0, 1]\).

Options:

**InnerR1**  
Inner radius of Frustum at endpoint 1  
Type: float  
Default value: 0

**InnerR2**  
Inner radius of Frustum at endpoint 2  
Type: float  
Default value: 0

**InnerV1**  
Mesh size at point 1, inner radius  
Type: float  
Default value: 0.1

**InnerV2**  
Mesh size at point 2, inner radius  
Type: float  
Default value: 0.1

**OuterR1**  
Outer radius of Frustum at endpoint 1  
Type: float  
Default value: 1

**OuterR2**  
Outer radius of Frustum at endpoint 2  
Type: float  
Default value: 1

**OuterV1**  
Mesh size at point 1, outer radius  
Type: float  
Default value: 1

**OuterV2**  
Mesh size at point 2, outer radius  
Type: float  
Default value: 1

**X1**  
X coordinate of endpoint 1  
Type: float  
Default value: 0

**X2**  
X coordinate of endpoint 2  
Type: float  
Default value: 0

**Y1**  
Y coordinate of endpoint 1  
Type: float  
Default value: 0

**Y2**  
Y coordinate of endpoint 2  
Type: float  
Default value: 0

**Z1**  
Z coordinate of endpoint 1  
Type: float  
Default value: 1
Z2  Z coordinate of endpoint 2
    Type: float
    Default value: 0

**Gradient**  Compute the finite difference gradient of Field[InField]:

\[
F = \frac{\text{Field}[\text{InField}](X + \Delta/2) - \text{Field}[\text{InField}](X - \Delta/2)}{\Delta}
\]

Options:

**Delta**  Finite difference step
    Type: float
    Default value: 0.0003464101615137755

**InField**  Input field tag
    Type: integer
    Default value: 1

**Kind**  Component of the gradient to evaluate: 0 for X, 1 for Y, 2 for Z, 3 for the norm
    Type: integer
    Default value: 3

**IntersectAniso**  Take the intersection of 2 anisotropic fields according to Alauzet.

Options:

**FieldsList**  Field indices
    Type: list
    Default value: {}

**Laplacian**  Compute finite difference the Laplacian of Field[InField]:

\[
F = G(x+d,y,z) + G(x-d,y,z) + G(x,y+d,z) + G(x,y-d,z) + G(x,y,z+d) + G(x,y,z-d) - 6 * G(x,y,z),
\]

where \( G = \text{Field}[\text{InField}] \) and \( d = \Delta \).

Options:

**Delta**  Finite difference step
    Type: float
    Default value: 0.0003464101615137755

**InField**  Input field tag
    Type: integer
    Default value: 1

**LonLat**  Evaluate Field[InField] in geographic coordinates (longitude, latitude):
\[ F = \text{Field}[\text{InField}](\atan(y/x), \asin(z/\sqrt{x^2 + y^2 + z^2})) \]

Options:

FromStereo
- If = 1, the mesh is in stereographic coordinates: \( x_i = 2Rx/(R+z), \) \( \eta = 2Ry/(R+z) \)
  - Type: integer
  - Default value: 0

InField
- Tag of the field to evaluate
  - Type: integer
  - Default value: 1

RadiusStereo
- Radius of the sphere of the stereographic coordinates
  - Type: float
  - Default value: 6371000

MathEval
- Evaluate a mathematical expression. The expression can contain \( x, y, z \) for spatial coordinates, \( F_0, F_1, \ldots \) for field values, and mathematical functions.

Options:

- **F**
  - Mathematical function to evaluate
  - Type: string
  - Default value: "\( Fz + \sin(z) \)"

MathEvalAniso
- Evaluate a metric expression. The expressions can contain \( x, y, z \) for spatial coordinates, \( F_0, F_1, \ldots \) for field values, and mathematical functions.

Options:

- **M11**
  - Element 11 of the metric tensor
  - Type: string
  - Default value: "\( F2 + \sin(z) \)"

- **M12**
  - Element 12 of the metric tensor
  - Type: string
  - Default value: "\( F2 + \sin(z) \)"

- **M13**
  - Element 13 of the metric tensor
  - Type: string
  - Default value: "\( F2 + \sin(z) \)"

- **M22**
  - Element 22 of the metric tensor
  - Type: string
  - Default value: "\( F2 + \sin(z) \)"

- **M23**
  - Element 23 of the metric tensor
  - Type: string
  - Default value: "\( F2 + \sin(z) \)"

- **M33**
  - Element 33 of the metric tensor
  - Type: string
  - Default value: "\( F2 + \sin(z) \)"
Max  Take the maximum value of a list of fields.

Options:

FieldsList
   Field indices
   Type: list
   Default value: {}
**MinAniso**  Take the intersection of a list of possibly anisotropic fields.

Options:

**FieldsList**  Field indices
Type: list
Default value: {}

**Octree**  Pre compute another field on an octree to speed-up evaluation.

Options:

**InField**  Id of the field to represent on the octree
Type: integer
Default value: 1

**Param**  Evaluate Field[InField] in parametric coordinates:

\[ F = \text{Field}[\text{InField}](FX,FY,FZ) \]

See the MathEval Field help to get a description of valid FX, FY and FZ expressions.

Options:

**FX**  X component of parametric function
Type: string
Default value: ""

**FY**  Y component of parametric function
Type: string
Default value: ""

**FZ**  Z component of parametric function
Type: string
Default value: ""

**InField**  Input field tag
Type: integer
Default value: 1

**PostView**  Evaluate the post processing view with index ViewIndex, or with tag ViewTag if ViewTag is positive.

Options:

**CropNegativeValues**  return MAX_LC instead of a negative value (this option is needed for backward compatibility with the BackgroundMesh option)
Type: boolean
Default value: 1
UseClosest
Use value at closest node if no exact match is found
Type: boolean
Default value: 1

ViewIndex
Post-processing view index
Type: integer
Default value: 0

ViewTag
Post-processing view tag
Type: integer
Default value: -1

Restrict
Restrict the application of a field to a given list of geometrical points, curves, surfaces or volumes (as well as their boundaries if IncludeBoundary is set).

Options:

CurvesList
Curve tags
Type: list
Default value: {}

InField
Input field tag
Type: integer
Default value: 1

IncludeBoundary
Include the boundary of the entities
Type: boolean
Default value: 1

PointsList
Point tags
Type: list
Default value: {}

SurfacesList
Surface tags
Type: list
Default value: {}

VolumesList
Volume tags
Type: list
Default value: {}

Structured
Linearly interpolate between data provided on a 3D rectangular structured grid.

The format of the input file is:

Ox Oy Oz
Dx Dy Dz
nx ny nz
$v(0,0,0) \ v(0,0,1) \ v(0,0,2) \ ...
\ v(0,1,0) \ v(0,1,1) \ v(0,1,2) \ ...
\ v(0,2,0) \ v(0,2,1) \ v(0,2,2) \ ...
\ ...
\ ...
\ v(1,0,0) \ ...
$

where $O$ are the coordinates of the first node, $D$ are the distances between nodes in each direction, $n$ are the numbers of nodes in each direction, and $v$ are the values on each node.

Options:

**FileName**  Name of the input file  
Type: path  
Default value: "",

**OutsideValue**  Value of the field outside the grid (only used if the "SetOutsideValue" option is true).  
Type: float  
Default value: $1e+22$

**SetOutsideValue**  True to use the "OutsideValue" option. If False, the last values of the grid are used.  
Type: boolean  
Default value: 0

**TextFormat**  True for ASCII input files, false for binary files (4 bite signed integers for $n$, double precision floating points for $v$, $D$ and $O$)  
Type: boolean  
Default value: 0

**Threshold**  Return $F = \text{SizeMin}$ if $\text{Field}[\text{InField}] \leq \text{DistMin}$, $F = \text{SizeMax}$ if $\text{Field}[\text{InField}] \geq \text{DistMax}$, and the interpolation between $\text{SizeMin}$ and $\text{SizeMax}$ if $\text{DistMin} < \text{Field}[\text{InField}] < \text{DistMax}$.

Options:

**DistMax**  Value after which the mesh size will be $\text{SizeMax}$  
Type: float  
Default value: 10

**DistMin**  Value up to which the mesh size will be $\text{SizeMin}$  
Type: float  
Default value: 1

**InField**  Tag of the field computing the input value, usually a distance  
Type: integer  
Default value: 0

**Sigmoid**  True to interpolate between $\text{SizeMin}$ and $LcMax$ using a sigmoid, false to interpolate linearly
Type: boolean
Default value: 0

**SizeMax**  Mesh size when value > DistMax
Type: float
Default value: 1

**SizeMin**  Mesh size when value < DistMin
Type: float
Default value: 0.1

**StopAtDistMax**
True to not impose mesh size outside DistMax (i.e., $F = a$ very big value if Field[InField] > DistMax)
Type: boolean
Default value: 0
Chapter 9: Gmsh plugins

This chapter lists all the plugins that are bundled in the official Gmsh distribution. Plugins are available in the GUI (by right-clicking on a view button, or by clicking on the black arrow next to the view button, and then selecting the ‘Plugin’ submenu), in the scripting language (see Section 5.4 [Post-processing scripting commands], page 119 and in the API (see Section 6.12 [Namespace gmsh/plugin], page 211). See Section 2.9 [t9], page 36 for an example on how to use plugins.

Plugin(AnalyseMeshQuality)

Plugin(AnalyseMeshQuality) analyses the quality of the elements of a given dimension in the current model. Depending on the input parameters it computes the minimum of the Jacobian determinant (J), the IGE quality measure (Inverse Gradient Error) and/or the ICN quality measure (Condition Number). Statistics are printed and, if requested, a model-based post-processing view is created for each quality measure. The plugin can optionally hide elements by comparing the measure to a prescribed threshold.

J is faster to compute but gives information only on element validity while the other measures also give information on element quality. The IGE measure is related to the error on the gradient of the finite element solution. It is the scaled Jacobian for quads and hexes and a new measure for triangles and tetrahedra. The ICN measure is related to the condition number of the stiffness matrix. (See the article "Efficient computation of the minimum of shape quality measures on curvilinear finite elements" for details.)

Parameters:

- 'JacobianDeterminant': compute J?
- 'IGEMeasure': compute IGE?
- 'ICNMeasure': compute ICN?
- 'HidingThreshold': hide all elements for which min(mu) is strictly greater than (if 'ThresholdGreater' == 1) or less than (if 'ThresholdGreater' == 0) the threshold, where mu is ICN if 'ICNMeasure' == 1, IGE if 'IGEMeasure' == 1 or min(J)/max(J) if 'JacobianDeterminant' == 1.
- 'CreateView': create a model-based view of min(J)/max(J), min(IGE) and/or min(ICN)?
- 'Recompute': force recomputation (set to 1 if the mesh has changed).
- 'DimensionOfElements': analyse elements of the given dimension if equal to 1, 2 or 3; analyse 2D and 3D elements if equal to 4; or analyse elements of the highest dimension if equal to -1. Numeric options:

  JacobianDeterminant
  Default value: 0

  IGEMeasure
  Default value: 0
ICNMeasure
Default value: 0

HidingThreshold
Default value: 99

ThresholdGreater
Default value: 1

CreateView
Default value: 0

Recompute
Default value: 0

DimensionOfElements
Default value: -1

Plugin(Annotate)
Plugin(Annotate) adds the text string ‘Text’, in font ‘Font’ and size ‘FontSize’, in the view ‘View’. The string is aligned according to ‘Align’.

If ‘ThreeD’ is equal to 1, the plugin inserts the string in model coordinates at the position (‘X’, ‘Y’, ‘Z’). If ‘ThreeD’ is equal to 0, the plugin inserts the string in screen coordinates at the position (‘X’, ‘Y’).

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Annotate) is executed in-place for list-based datasets or creates a new list-based view for other datasets. String options:

Text Default value: "My Text"
Font Default value: "Helvetica"
Align Default value: "Left"

Numeric options:
X Default value: 50
Y Default value: 30
Z Default value: 0
ThreeD Default value: 0
FontSize Default value: 14
View Default value: -1

Plugin(BoundaryAngles)
Plugin(BoundaryAngles) computes the (interior) angles between the line elements on the boundary of all surfaces. The angles, computed modulo 2*Pi, are stored in a new post-processing view, one for each surface. The plugin currently only works for planar surfaces.

Available options: Visible (1=True, 0 = False, Default = 1): Visibility of the Views in the GUI - Save (1=True, 0 = False, Default = 0): Save the Views on disk? - Remove (1=True, 0 = False, Default = 0): Remove the View from the memory after execution? - Filename (Default = 'Angles_Surface'): Root name for the Views (in case of save / Visibility) - Dir (Default = ""): Output directory (possibly nested)

String options:
Plugin(Bubbles)

Plugin(Bubbles) constructs a geometry consisting of ‘bubbles’ inscribed in the Voronoi of an input triangulation. ‘ShrinkFactor’ allows to change the size of the bubbles. The plugin expects a triangulation in the ‘z = 0’ plane to exist in the current model.

Plugin(Bubbles) creates one ‘.geo’ file. String options:

OutputFile
  Default value: "bubbles.geo"

Numeric options:

ShrinkFactor
  Default value: 0

Plugin(Crack)

Plugin(Crack) creates a crack around the physical group ‘PhysicalGroup’ of dimension ‘Dimension’ (1 or 2), embedded in a mesh of dimension ‘Dimension’ + 1. The plugin duplicates the nodes and the elements on the crack and stores them in a new discrete curve (‘Dimension’ = 1) or surface (‘Dimension’ = 2). The elements touching the crack on the positive side are modified to use the newly generated nodes. If ‘OpenBoundaryPhysicalGroup’ is given (> 0), its nodes are duplicated and the crack will be left open on that (part of the) boundary. Otherwise, the lips of the crack are sealed, i.e., its nodes are not duplicated. If ‘AuxiliaryPhysicalGroup’ is given (> 0), its elements are considered in addition to those in ‘PhysicalGroup’ for the logic that groups the elements into the positive and negative side of the crack. However, the nodes in ‘AuxiliaryPhysicalGroup’ are not duplicated (unless they are also in ‘PhysicalGroup’). This can be useful to treat corner cases in non-trivial geometries. For 1D cracks, ‘NormalX’, ‘NormalY’ and ‘NormalZ’ provide the reference normal of the surface in which the crack is supposed to be embedded. If ‘NewPhysicalGroup’ is positive, use it as the tag of the newly created curve or surface; otherwise use ‘PhysicalGroup’. Numeric options:

Dimension
  Default value: 1

PhysicalGroup
  Default value: 1

OpenBoundaryPhysicalGroup
  Default value: 0

AuxiliaryPhysicalGroup
  Default value: 0

NormalX
  Default value: 0
NormalY  Default value: 0
NormalZ  Default value: 1
NewPhysicalGroup  Default value: 0
DebugView  Default value: 0

Plugin(Curl)
Plugin(Curl) computes the curl of the field in the view ‘View’.
If ‘View’ < 0, the plugin is run on the current view.

Plugin(Curl) creates one new list-based view. Numeric options:
View  Default value: -1

Plugin(CurvedBndDist)
Plugin(CurvedBndDist) ...

Plugin(CutBox)
Plugin(CutBox) cuts the view ‘View’ with a rectangular box defined by the 4 points
(‘X0’,‘Y0’,‘Z0’) (origin), (‘X1’,‘Y1’,‘Z1’) (axis of U), (‘X2’,‘Y2’,‘Z2’) (axis of V) and
(‘X3’,‘Y3’,‘Z3’) (axis of W).
The number of points along U, V, W is set with the options ‘NumPointsU’, ‘NumPointsV’ and ‘NumPointsW’.
If ‘ConnectPoints’ is zero, the plugin creates points; otherwise, the plugin generates
hexahedra, quadrangles, lines or points depending on the values of ‘NumPointsU’,
‘NumPointsV’ and ‘NumPointsW’.
If ‘Boundary’ is zero, the plugin interpolates the view inside the box; otherwise the
plugin interpolates the view at its boundary.
If ‘View’ < 0, the plugin is run on the current view.

Plugin(CutBox) creates one new list-based view. Numeric options:
X0  Default value: 0
Y0  Default value: 0
Z0  Default value: 0
X1  Default value: 1
Y1  Default value: 0
Z1  Default value: 0
X2  Default value: 0
Y2  Default value: 1
Z2  Default value: 0
X3  Default value: 0
Y3  Default value: 0
Chapter 9: Gmsh plugins

Z3
   Default value: 1

NumPointsU
   Default value: 20

NumPointsV
   Default value: 20

NumPointsW
   Default value: 20

ConnectPoints
   Default value: 1

Boundary
   Default value: 1

View
   Default value: -1

Plugin(CutGrid)

Plugin(CutGrid) cuts the view ‘View’ with a rectangular grid defined by the 3 points

The number of points along U and V is set with the options ‘NumPointsU’ and
‘NumPointsV’.

If ‘ConnectPoints’ is zero, the plugin creates points; otherwise, the plugin generates
quadrangles, lines or points depending on the values of ‘NumPointsU’ and ‘NumPointsV’.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(CutGrid) creates one new list-based view. Numeric options:

X0
   Default value: 0

Y0
   Default value: 0

Z0
   Default value: 0

X1
   Default value: 1

Y1
   Default value: 0

Z1
   Default value: 0

X2
   Default value: 0

Y2
   Default value: 1

Z2
   Default value: 0

NumPointsU
   Default value: 20

NumPointsV
   Default value: 20

ConnectPoints
   Default value: 1

View
   Default value: -1
Plugin(CutMesh)
Plugin(CutMesh) cuts the mesh of the current GModel with the zero value of the levelset defined with the view 'View'. Sub-elements are created in the new model (polygons in 2D and polyhedra in 3D) and border elements are created on the zero-levelset.

If 'Split' is nonzero, the plugin splits the mesh along the edges of the cut elements in the positive side.

If 'SaveTri' is nonzero, the sub-elements are saved as simplices.

Plugin(CutMesh) creates one new GModel. Numeric options:

- **View** Default value: -1
- **Split** Default value: 0
- **SaveTri** Default value: 0

Plugin(CutParametric)
Plugin(CutParametric) cuts the view 'View' with the parametric function (‘X’(u,v), ‘Y’(u,v), ‘Z’(u,v)), using ‘NumPointsU’ values of the parameter u in [‘MinU’, ‘MaxU’] and ‘NumPointsV’ values of the parameter v in [‘MinV’, ‘MaxV’].

If 'ConnectPoints' is set, the plugin creates surface or line elements; otherwise, the plugin generates points.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(CutParametric) creates one new list-based view. String options:

- **X** Default value: "2 * Cos(u) * Sin(v)"
- **Y** Default value: "4 * Sin(u) * Sin(v)"
- **Z** Default value: "0.1 + 0.5 * Cos(v)"

Numeric options:

- **MinU** Default value: 0
- **MaxU** Default value: 6.2832
- **NumPointsU** Default value: 180
- **MinV** Default value: 0
- **MaxV** Default value: 6.2832
- **NumPointsV** Default value: 180
- **ConnectPoints** Default value: 0
- **View** Default value: -1

Plugin(CutPlane)
Plugin(CutPlane) cuts the view 'View' with the plane ‘A’*X + ‘B’*Y + ‘C’*Z + ‘D’ = 0.
If ‘ExtractVolume’ is nonzero, the plugin extracts the elements on one side of the plane (depending on the sign of ‘ExtractVolume’).

If ‘View’ < 0, the plugin is run on the current view.

Plugin(CutPlane) creates one new list-based view. Numeric options:

A
Default value: 1
B
Default value: 0
C
Default value: 0
D
Default value: -0.01

ExtractVolume
Default value: 0

RecurLevel
Default value: 3

TargetError
Default value: 0.0001

View
Default value: -1

Plugin(CutSphere)

Plugin(CutSphere) cuts the view ‘View’ with the sphere \((X-Xc)^2 + (Y-Yc)^2 + (Z-Zc)^2 = R^2\).

If ‘ExtractVolume’ is nonzero, the plugin extracts the elements inside (if ‘ExtractVolume’ < 0) or outside (if ‘ExtractVolume’ > 0) the sphere.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(CutSphere) creates one new list-based view. Numeric options:

Xc
Default value: 0
Yc
Default value: 0
Zc
Default value: 0
R
Default value: 0.25

ExtractVolume
Default value: 0

RecurLevel
Default value: 3

TargetError
Default value: 0.0001

View
Default value: -1

Plugin(DiscretizationError)

Plugin(DiscretizationError) computes the error between the mesh and the geometry. It does so by supersampling the elements and computing the distance between the supersampled points dans their projection on the geometry. Numeric options:
SuperSamplingNodes
  Default value: 10

Plugin(Distance)
  Plugin(Distance) computes distances to entities in a mesh.
  
  If ‘PhysicalPoint’, ‘PhysicalLine’ and ‘PhysicalSurface’ are 0, the distance is computed to all the boundaries. Otherwise the distance is computed to the given physical group.

  If ‘DistanceType’ is 0, the plugin computes the geometrical Euclidean distance using the naive $O(N^2)$ algorithm. If ‘DistanceType’ > 0, the plugin computes an approximate distance by solving a PDE with a diffusion constant equal to ‘DistanceType’ time the maximum size of the bounding box of the mesh as in [Legrand et al. 2006].

  Positive ‘MinScale’ and ‘MaxScale’ scale the distance function.

  Plugin(Distance) creates one new list-based view. Numeric options:

  PhysicalPoint
    Default value: 0

  PhysicalLine
    Default value: 0

  PhysicalSurface
    Default value: 0

  DistanceType
    Default value: 0

  MinScale
    Default value: 0

  MaxScale
    Default value: 0

Plugin(Divergence)
  Plugin(Divergence) computes the divergence of the field in the view ‘View’.

  If ‘View’ < 0, the plugin is run on the current view.

  Plugin(Divergence) creates one new list-based view. Numeric options:

  View
    Default value: -1

Plugin(Eigenvalues)
  Plugin(Eigenvalues) computes the three real eigenvalues of each tensor in the view ‘View’.

  If ‘View’ < 0, the plugin is run on the current view.

  Plugin(Eigenvalues) creates three new list-based scalar views. Numeric options:

  View
    Default value: -1

Plugin(Eigenvectors)
  Plugin(Eigenvectors) computes the three (right) eigenvectors of each tensor in the view ‘View’ and sorts them according to the value of the associated eigenvalues.

  If ‘ScaleByEigenvalues’ is set, each eigenvector is scaled by its associated eigenvalue.
The plugin gives an error if the eigenvectors are complex.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Eigenvectors) creates three new list-based vector view. Numeric options:

ScaleByEigenvalues
   Default value: 1

View
   Default value: -1

Plugin(ExtractEdges)
   Plugin(ExtractEdges) extracts sharp edges from a triangular mesh.

Plugin(ExtractEdges) creates one new view. Numeric options:

Angle
   Default value: 40

IncludeBoundary
   Default value: 1

Plugin(ExtractElements)
   Plugin(ExtractElements) extracts some elements from the view ‘View’.
   If ‘MinVal’ != ‘MaxVal’, it extracts the elements whose ‘TimeStep’-th values (averaged by element)
   are comprised between ‘MinVal’ and ‘MaxVal’. If ‘Visible’ != 0, it extracts visible elements.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(ExtractElements) creates one new list-based view. Numeric options:

MinVal
   Default value: 0

MaxVal
   Default value: 0

TimeStep
   Default value: 0

Visible
   Default value: 1

Dimension
   Default value: -1

View
   Default value: -1

Plugin(FieldFromAmplitudePhase)
   Plugin(FieldFromAmplitudePhase) builds a complex field ‘u’ from amplitude ‘a’ (complex)
   and phase ‘phi’ given in two different ‘Views’ u = a * exp(k*phi), with k the wavenumber.

The result is to be interpolated in a sufficiently fine mesh: ‘MeshFile’.

Plugin(FieldFromAmplitudePhase) generates one new view. String options:

MeshFile
   Default value: "fine.msh"

Numeric options:

Wavenumber
   Default value: 5

AmplitudeView
   Default value: 0
PhaseView
  Default value: 1

Plugin(GaussPoints)
  Given an input mesh, Plugin(GaussPoints) creates a list-based view containing the
  Gauss points for a given polynomial ‘Order’.

  If ‘PhysicalGroup’ is nonzero, the plugin only creates points for the elements be-
  longing to the group. Numeric options:
  
  Order  Default value: 0
  Dimension  Default value: 2
  PhysicalGroup  Default value: 0

Plugin(Gradient)
  Plugin(Gradient) computes the gradient of the field in the view ‘View’.

  If ‘View’ < 0, the plugin is run on the current view.

  Plugin(Gradient) creates one new list-based view. Numeric options:
  
  View  Default value: -1

Plugin(HarmonicToTime)
  Plugin(HarmonicToTime) takes the values in the time steps ‘RealPart’ and ‘Imagi-
  naryPart’ of the view ‘View’, and creates a new view containing

  ‘View’[‘RealPart’] * cos(p) + ‘View’[‘ImaginaryPart’] * sin(p)

  with
  p = 2*Pi*k/’NumSteps’, k = 0, ..., ‘NumSteps’-1
  and ‘NumSteps’ the total number of time steps
  over ‘NumPeriods’ periods at frequency ‘Frequency’ [Hz].
  The ‘+’ sign is used if ‘TimeSign’>0, the ‘-’ sign otherwise.

  If ‘View’ < 0, the plugin is run on the current view.

  Plugin(HarmonicToTime) creates one new list-based view. Numeric options:
  
  RealPart  Default value: 0
  ImaginaryPart  Default value: 1
  NumSteps  Default value: 20
  TimeSign  Default value: -1
  Frequency  Default value: 1
  NumPeriods  Default value: 1
  View  Default value: -1
Plugin(HomologyComputation)

Plugin(HomologyComputation) computes representative chains of basis elements of (relative) homology and cohomology spaces.

Define physical groups in order to specify the computation domain and the relative subdomain. Otherwise the whole mesh is the domain and the relative subdomain is empty.

Plugin(HomologyComputation) creates new views, one for each basis element. The resulting basis chains of desired dimension together with the mesh are saved to the given file. String options:

- **DomainPhysicalGroups**
  Default value: ""

- **SubdomainPhysicalGroups**
  Default value: ""

- **ReductionImmunePhysicalGroups**
  Default value: ""

- **DimensionOfChainsToSave**
  Default value: "0, 1, 2, 3"

- **Filename**
  Default value: "homology.msh"

Numeric options:

- **ComputeHomology**
  Default value: 1

- **ComputeCohomology**
  Default value: 0

- **HomologyPhysicalGroupsBegin**
  Default value: -1

- **CohomologyPhysicalGroupsBegin**
  Default value: -1

- **CreatePostProcessingViews**
  Default value: 1

- **ReductionOmit**
  Default value: 1

- **ReductionCombine**
  Default value: 3

- **PostProcessSimplify**
  Default value: 1

- **ReductionHeuristic**
  Default value: 1

Plugin(HomologyPostProcessing)

Plugin(HomologyPostProcessing) operates on representative basis chains of homology and cohomology spaces. Functionality:

1. (co)homology basis transformation:
   'TransformationMatrix': Integer matrix of the transformation.
'PhysicalGroupsOfOperatedChains': (Co)chains of a (co)homology space basis to be transformed.
Results a new (co)chain basis that is an integer combination of the given basis.

2. Make basis representations of a homology space and a cohomology space compatible:
'PhysicalGroupsOfOperatedChains': Chains of a homology space basis.
'PhysicalGroupsOfOperatedChains2': Cochains of a cohomology space basis.
Results a new basis for the homology space such that the incidence matrix of the new basis and the basis of the cohomology space is the identity matrix.

Options:
'PhysicalGroupsToTraceResults': Trace the resulting (co)chains to the given physical groups.
'PhysicalGroupsToProjectResults': Project the resulting (co)chains to the complement of the given physical groups.
'NameForResultChains': Post-processing view name prefix for the results.
'ApplyBoundaryOperatorToResults': Apply boundary operator to the resulting chains.

String options:
TransformationMatrix
  Default value: "1, 0; 0, 1"
PhysicalGroupsOfOperatedChains
  Default value: "1, 2"
PhysicalGroupsOfOperatedChains2
  Default value: ""
PhysicalGroupsToTraceResults
  Default value: ""
PhysicalGroupsToProjectResults
  Default value: ""
NameForResultChains
  Default value: "c"

Numeric options:
ApplyBoundaryOperatorToResults
  Default value: 0

Plugin(Integrate)
Plugin(Integrate) integrates a scalar field over all the elements of the view 'View' (if 'Dimension' < 0), or over all elements of the prescribed dimension (if 'Dimension' > 0). If the field is a vector field, the circulation/flux of the field over line/surface elements is calculated.

If 'View' < 0, the plugin is run on the current view.

If 'OverTime' = i > -1 , the plugin integrates the scalar view over time (using the trapezoidal rule) instead of over space, starting at step i. If 'Visible' = 1, the plugin only integrates over visible entities.
Plugin(Integrate) creates one new list-based view. Numeric options:

- **View**
  - Default value: -1
- **OverTime**
  - Default value: -1
- **Dimension**
  - Default value: -1
- **Visible**
  - Default value: 1

Plugin(Invisible)

Plugin(Invisible) deletes (if ‘DeleteElements’ is set) or reverses (if ‘ReverseElements’ is set) all the invisible elements in the current model. If the bounding box defined by ‘XMin’ < x < ‘XMax’, ‘YMin’ < y < ‘YMax’ and ‘ZMin’ < z < ‘ZMax’ is not empty, mark all elements outside the bounding box as invisible prior to deleting or inverting the elements. Numeric options:

- **DeleteElements**
  - Default value: 1
- **ReverseElements**
  - Default value: 0
- **XMin**
  - Default value: 0
- **YMin**
  - Default value: 0
- **ZMin**
  - Default value: 0
- **XMax**
  - Default value: 0
- **YMax**
  - Default value: 0
- **ZMax**
  - Default value: 0

Plugin(Isosurface)

Plugin(Isosurface) extracts the isosurface of value ‘Value’ from the view ‘View’, and draws the ‘OtherTimeStep’-th step of the view ‘OtherView’ on this isosurface. If ‘ExtractVolume’ is nonzero, the plugin extracts the isovolume with values greater (if ‘ExtractVolume’ > 0) or smaller (if ‘ExtractVolume’ < 0) than the isosurface ‘Value’.

If ‘OtherTimeStep’ < 0, the plugin uses, for each time step in ‘View’, the corresponding time step in ‘OtherView’. If ‘OtherView’ < 0, the plugin uses ‘View’ as the value source.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Isosurface) creates as many list-based views as there are time steps in ‘View’. Numeric options:

- **Value**
  - Default value: 0
- **ExtractVolume**
  - Default value: 0
- **RecurLevel**
  - Default value: 3
**TargetError**
Default value: 0.0001

**View**
Default value: -1

**OtherTimeStep**
Default value: -1

**OtherView**
Default value: -1

**Plugin(Lambda2)**
Plugin(Lambda2) computes the eigenvalues \( \Lambda(1,2,3) \) of the tensor \((S_{ik} S_{kj} + \Omega_{ik} \Omega_{kj})\), where \( S_{ij} = 0.5 (u_{i,j} + u_{j,i}) \) and \( \Omega_{ij} = 0.5 (u_{i,j} - u_{j,i}) \) are respectively the symmetric and antisymmetric parts of the velocity gradient tensor.

Vortices are well represented by regions where \( \Lambda(2) \) is negative.

If ‘View’ contains tensor elements, the plugin directly uses the tensors as the values of the velocity gradient tensor; if ‘View’ contains vector elements, the plugin uses them as the velocities from which to derive the velocity gradient tensor.

If ‘View’ < 0, the plugin is run on the current view.

**Plugin(Lambda2)** creates one new list-based view. Numeric options:

**Eigenvalue**
Default value: 2

**View**
Default value: -1

**Plugin(LongitudeLatitude)**
Plugin(LongitudeLatitude) projects the view ‘View’ in longitude-latitude.

If ‘View’ < 0, the plugin is run on the current view.

**Plugin(LongitudeLatitude)** is executed in place. Numeric options:

**View**
Default value: -1

**Plugin(MakeSimplex)**
Plugin(MakeSimplex) decomposes all non-simplectic elements (quadrangles, prisms, hexahedra, pyramids) in the view ‘View’ into simplices (triangles, tetrahedra).

If ‘View’ < 0, the plugin is run on the current view.

**Plugin(MakeSimplex)** is executed in-place. Numeric options:

**View**
Default value: -1

**Plugin(MathEval)**
Plugin(MathEval) creates a new view using data from the time step ‘TimeStep’ in the view ‘View’.

If only ‘Expression0’ is given (and ‘Expression1’, ..., ‘Expression8’ are all empty), the plugin creates a scalar view. If ‘Expression0’, ‘Expression1’ and/or ‘Expression2’ are given (and ‘Expression3’, ..., ‘Expression8’ are all empty) the plugin creates a vector view. Otherwise the plugin creates a tensor view.
In addition to the usual mathematical functions (Exp, Log, Sqrt, Sin, Cos, Fabs, etc.) and operators (+, -, *, /, ^), all expressions can contain:

- the symbols v0, v1, v2, ..., vn, which represent the n components in ‘View’;

- the symbols w0, w1, w2, ..., wn, which represent the n components of ‘OtherView’, at time step ‘OtherTimeStep’;

- the symbols x, y and z, which represent the three spatial coordinates.

If ‘TimeStep’ < 0, the plugin extracts data from all the time steps in the view.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(MathEval) creates one new view. If ‘PhysicalRegion’ < 0, the plugin is run on all physical regions. If ‘Dimension’ > 0, only search for elements of the given dimension.

Plugin(MathEval) creates one new list-based view. String options:

Expression0
  Default value: "$Sqrt(v0^2+v1^2+v2^2)"

Expression1
  Default value: ""

Expression2
  Default value: ""

Expression3
  Default value: ""

Expression4
  Default value: ""

Expression5
  Default value: ""

Expression6
  Default value: ""

Expression7
  Default value: ""

Expression8
  Default value: ""

Numeric options:

TimeStep  Default value: -1

View      Default value: -1

OtherTimeStep
  Default value: -1

OtherView
  Default value: -1
**ForceInterpolation**
  Default value: 0

**PhysicalRegion**
  Default value: -1

**Dimension**
  Default value: -1

**Plugin(MeshSizeFieldView)**  
Plugin(MeshSizeFieldView) evaluates the mesh size field ‘MeshSizeField’ on specified ‘Component’ (0 for scalar) of the post-processing view ‘View’. Numeric options:

- **MeshSizeField**
  Default value: 0

- **View**
  Default value: -1

- **Component**
  Default value: 0

**Plugin(MeshSubEntities)**  
Plugin(MeshSubEntities) creates mesh elements for the entities of dimension ‘OutputDimension’ (0 for vertices, 1 for edges, 2 for faces) of the ‘InputPhysicalGroup’ of dimension ‘InputDimension’. The plugin creates new elements belonging to ‘OutputPhysicalGroup’. Numeric options:

- **InputDimension**
  Default value: 1

- **InputPhysicalGroup**
  Default value: 1

- **OutputDimension**
  Default value: 0

- **OutputPhysicalGroup**
  Default value: 2000

**Plugin(MeshVolume)**  
Plugin(MeshVolume) computes the volume of the mesh.

Only the elements in the physical group ‘PhysicalGroup’ of dimension ‘Dimension’ are taken into account, unless ‘PhysicalGroup’ is negative, in which case all the elements of the given ‘Dimension’ are considered. If ‘Dimension’ is negative, all the elements are considered.

Plugin(MeshVolume) creates one new list-based view. Numeric options:

- **PhysicalGroup**
  Default value: -1

- **Dimension**
  Default value: 3

**Plugin(MinMax)**  
Plugin(MinMax) computes the min/max of a view.

If ‘View’ < 0, the plugin is run on the current view. If ‘OverTime’ = 1, the plugin calculates the min/max over space and time. If ‘Argument’ = 1, the plugin calculates
the min/max and the argmin/argmax. If ‘Visible’ = 1, the plugin is only applied to visible entities.

Plugin(MinMax) creates two new list-based views. Numeric options:

- **View** Default value: -1
- **OverTime** Default value: 0
- **Argument** Default value: 0
- **Visible** Default value: 1

**Plugin(ModifyComponents)**

Plugin(ModifyComponents) modifies the components of the ‘TimeStep’-th time step in the view ‘View’, using the expressions provided in ‘Expression0’, ..., ‘Expression8’. If an expression is empty, the corresponding component in the view is not modified.

The expressions can contain:

- the usual mathematical functions (Log, Sqrt, Sin, Cos, Fabs, ...) and operators (+, -, *, /, ^);
- the symbols x, y and z, to retrieve the coordinates of the current node;
- the symbols Time and TimeStep, to retrieve the current time and time step values;
- the symbols v0, v1, v2, ..., v8, to retrieve each component of the field in ‘View’ at the ‘TimeStep’-th time step;
- the symbols w0, w1, w2, ..., w8, to retrieve each component of the field in ‘OtherView’ at the ‘OtherTimeStep’-th time step. If ‘OtherView’ and ‘View’ are based on different spatial grids, or if their data types are different, ‘OtherView’ is interpolated onto ‘View’.

If ‘TimeStep’ < 0, the plugin automatically loops over all the time steps in ‘View’ and evaluates the expressions for each one.

If ‘OtherTimeStep’ < 0, the plugin uses ‘TimeStep’ instead.

If ‘View’ < 0, the plugin is run on the current view.

If ‘OtherView’ < 0, the plugin uses ‘View’ instead.

Plugin(ModifyComponents) is executed in-place. String options:

- **Expression0** Default value: "v0 * Sin(x)"
- **Expression1** Default value: ""
- **Expression2** Default value: ""
- **Expression3** Default value: ""
Expression4  
   Default value: ""
Expression5  
   Default value: ""
Expression6  
   Default value: ""
Expression7  
   Default value: ""
Expression8  
   Default value: ""

Numeric options:

TimeStep  
   Default value: -1
View  
   Default value: -1
OtherTimeStep  
   Default value: -1
OtherView  
   Default value: -1
ForceInterpolation  
   Default value: 0

Plugin(ModulusPhase)

Plugin(ModulusPhase) interprets the time steps ‘realPart’ and ‘imaginaryPart’ in the view ‘View’ as the real and imaginary parts of a complex field and replaces them with their corresponding modulus and phase.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(ModulusPhase) is executed in-place. Numeric options:

RealPart  
   Default value: 0
ImaginaryPart  
   Default value: 1
View  
   Default value: -1

Plugin(NearToFarField)

Plugin(NearToFarField) computes the far field pattern from the near electric E and magnetic H fields on a surface enclosing the radiating device (antenna).

Parameters: the wavenumber, the angular discretisation (phi in [0, 2*Pi] and theta in [0, Pi]) of the far field sphere and the indices of the views containing the complex-valued E and H fields. If ‘Normalize’ is set, the far field is normalized to 1. If ‘dB’ is set, the far field is computed in dB. If ‘NegativeTime’ is set, E and H are assumed to have exp(-iwt) time dependency; otherwise they are assumed to have exp(+iwt) time dependency. If ‘MatlabOutputFile’ is given the raw far field data is also exported in Matlab format.

Plugin(NearToFarField) creates one new view. String options:

MatlabOutputFile  
   Default value: "farfield.m"
Numeric options:

Wavenumber
  Default value: 1
PhiStart  Default value: 0
PhiEnd    Default value: 6.28319
NumPointsPhi
  Default value: 60
ThetaStart
  Default value: 0
ThetaEnd  Default value: 3.14159
NumPointsTheta
  Default value: 30
EView     Default value: 0
HView     Default value: 1
Normalize
  Default value: 1
dB        Default value: 1
NegativeTime
  Default value: 0
RFar      Default value: 0

Plugin(NearestNeighbor)
  Plugin(NearestNeighbor) computes the distance from each point in ‘View’ to its nearest neighbor.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(NearestNeighbor) is executed in-place. Numeric options:

View     Default value: -1

Plugin(NewView)
  Plugin(NewView) creates a new model-based view from the current mesh, with ‘NumComp’ field components, set to value ‘Value’.

If ‘ViewTag’ is positive, force that tag for the created view. The view type is determined by ‘Type’ (NodeData or ElementData). In the case of an ElementData type, the view can be restricted to a specific physical group with a positive ‘PhysicalGroup’. String options:

Type     Default value: "NodeData"

Numeric options:

NumComp  Default value: 1
Value    Default value: 0
ViewTag  Default value: -1
PhysicalGroup
  Default value: -1
Plugin(Particles)

Plugin(Particles) computes the trajectory of particles in the force field given by the 'TimeStep'-th time step of a vector view 'View'.

The plugin takes as input a grid defined by the 3 points (X0’,Y0’,Z0’) (origin), (X1’,Y1’,Z1’) (axis of U) and (X2’,Y2’,Z2’) (axis of V).

The number of particles along U and V that are to be transported is set with the options 'NumPointsU' and 'NumPointsV'. The equation

\[ A2 \cdot \frac{d^2X(t)}{dt^2} + A1 \cdot \frac{dX(t)}{dt} + A0 \cdot X(t) = F \]

is then solved with the initial conditions X(t=0) chosen as the grid, dX/dt(t=0)=0, and with F interpolated from the vector view.

Time stepping is done using a Newmark scheme with step size ‘DT’ and ‘MaxIter’ maximum number of iterations.

If 'View' < 0, the plugin is run on the current view.

Plugin(Particles) creates one new list-based view containing multi-step vector points.

Numeric options:

<table>

</table>
**Plugin(Probe)**

Plugin(Probe) gets the value of the view ‘View’ at the point (‘X’, ‘Y’, ‘Z’).

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Probe) creates one new view. Numeric options:

- **X**  
  Default value: 0
- **Y**  
  Default value: 0
- **Z**  
  Default value: 0
- **View**  
  Default value: -1

**Plugin(Remove)**

Plugin(Remove) removes the marked items from the list-based view ‘View’.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Remove) is executed in-place. Numeric options:

- **Text2D**  
  Default value: 1
- **Text3D**  
  Default value: 1
- **Points**  
  Default value: 0
- **Lines**  
  Default value: 0
- **Triangles**  
  Default value: 0
- **Quadrangles**  
  Default value: 0
- **Tetrahedra**  
  Default value: 0
- **Hexahedra**  
  Default value: 0
- **Prisms**  
  Default value: 0
- **Pyramids**  
  Default value: 0
- **Scalar**  
  Default value: 1
- **Vector**  
  Default value: 1
- **Tensor**  
  Default value: 1
- **View**  
  Default value: -1

**Plugin(Scal2Tens)**

Plugin(Scal2Tens) converts some scalar fields into a tensor field. The number of components must be given (max. 9). The new view ‘NameNewView’ contains the new tensor field. If the number of a view is -1, the value of the corresponding component is 0. String options:

- **NameNewView**  
  Default value: "NewView"

Numeric options:
NumberofComponents
  Default value: 9

View0  Default value: -1
View1  Default value: -1
View2  Default value: -1
View3  Default value: -1
View4  Default value: -1
View5  Default value: -1
View6  Default value: -1
View7  Default value: -1
View8  Default value: -1

Plugin(Scal2Vec)
Plugin(Scal2Vec) converts the scalar fields into a vectorial field. The new view 'NameNewView' contains it. If the number of a view is -1, the value of the corresponding component of the vector field is 0. String options:

NameNewView
  Default value: "NewView"

Numeric options:
ViewX  Default value: -1
ViewY  Default value: -1
ViewZ  Default value: -1

Plugin(ShowNeighborElements)
Plugin(ShowNeighborElements) sets visible some elements and a layer of elements around them, the other being set invisible. Numeric options:

NumLayers
  Default value: 1
Element1  Default value: 0
Element2  Default value: 0
Element3  Default value: 0
Element4  Default value: 0
Element5  Default value: 0

Plugin(SimplePartition)
Plugin(SimplePartition) partitions the current mesh into ‘NumSlicesX’, ‘NumSlicesY’ and ‘NumSlicesZ’ slices along the X-, Y- and Z-axis, respectively. The distribution of these slices is governed by ‘MappingX’, ‘MappingY’ and ‘MappingZ’, where ‘t’ is a normalized absissa along each direction. (Setting ‘MappingX’ to ‘t’ will thus lead to equidistant slices along the X-axis.) String options:

MappingX  Default value: "t"
MappingY  Default value: "t"
MappingZ  Default value: "t"
Chapter 9: Gmsh plugins

Numeric options:

**NumSlicesX**
Default value: 4

**NumSlicesY**
Default value: 1

**NumSlicesZ**
Default value: 1

**Plugin(Skin)**

Plugin(Skin) extracts the boundary (skin) of the current mesh (if ‘FromMesh’ = 1),
or from the the view ‘View’ (in which case it creates a new view). If ‘View’ < 0 and
‘FromMesh’ = 0, the plugin is run on the current view.
If ‘Visible’ is set, the plugin only extracts the skin of visible entities. Numeric
options:

**Visible**  Default value: 1

**FromMesh**  Default value: 0

**View**  Default value: -1

**Plugin(Smooth)**

Plugin(Smooth) averages the values at the nodes of the view ‘View’.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Smooth) is executed in-place. Numeric options:

**View**  Default value: -1

**Plugin(SpanningTree)**

Plugin(SpanningTree) builds a tree spanning every vertex of a mesh and stores it
directly in the model.
The tree is constructed by starting first on the curves, then on the surfaces and
finally on the volumes.

Parameters
- PhysicalVolumes: list of the physical volumes upon which the tree must be built.
- PhysicalSurfaces: list of the physical surfaces upon which the tree must be built.
- PhysicalCurves: list of the physical curves upon which the tree must be built.
- OutputPhysical: physical tag of the generated tree (-1 will select a new tag auto-
matically).

Note - Lists must be comma separated integers and spaces are ignored.
Remark - This plugin does not overwrite a physical group. Therefore, if an existing
physical tag is used in OutputPhysical, the edges of the tree will be /added/ to the
specified group. String options:

**PhysicalVolumes**
Default value: ""

**PhysicalSurfaces**
Default value: ""

**PhysicalCurves**
Default value: ""
Numeric options:

OutputPhysical
Default value: -1

Plugin(SphericalRaise)

Plugin(SphericalRaise) transforms the coordinates of the elements in the view ‘View’ using the values associated with the ‘TimeStep’-th time step.

Instead of elevating the nodes along the X, Y and Z axes as with the View['View'].RaiseX, View['View'].RaiseY and View['View'].RaiseZ options, the raise is applied along the radius of a sphere centered at (‘Xc’, ‘Yc’, ‘Zc’).

To produce a standard radiation pattern, set ‘Offset’ to minus the radius of the sphere the original data lives on.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(SphericalRaise) is executed in-place. Numeric options:

\( Xc \) Default value: 0
\( Yc \) Default value: 0
\( Zc \) Default value: 0
\( \text{Raise} \) Default value: 1
\( \text{Offset} \) Default value: 0
\( \text{TimeStep} \) Default value: 0
\( \text{View} \) Default value: -1

Plugin(StreamLines)

Plugin(StreamLines) computes stream lines from the ‘TimeStep’-th time step of a vector view ‘View’ and optionally interpolates the scalar view ‘OtherView’ on the resulting stream lines.

The plugin takes as input a grid defined by the 3 points (‘X0’, ‘Y0’, ‘Z0’) (origin), (‘X1’, ‘Y1’, ‘Z1’) (axis of U) and (‘X2’, ‘Y2’, ‘Z2’) (axis of V).

The number of points along U and V that are to be transported is set with the options ‘NumPointsU’ and ‘NumPointsV’. The equation

\[
dX(t)/dt = V(x,y,z)
\]

is then solved with the initial condition \( X(t=0) \) chosen as the grid and with \( V(x,y,z) \) interpolated on the vector view.

The time stepping scheme is a RK44 with step size ‘DT’ and ‘MaxIter’ maximum number of iterations.

If ‘TimeStep’ < 0, the plugin tries to compute streamlines of the unsteady flow.

If ‘View’ < 0, the plugin is run on the current view.
Plugin(StreamLines) creates one new list-based view. This view contains multi-step vector points if ‘OtherView’ < 0, or single-step scalar lines if ‘OtherView’ >= 0. Numeric options:

X0 Default value: 0
Y0 Default value: 0
Z0 Default value: 0
X1 Default value: 1
Y1 Default value: 0
Z1 Default value: 0
X2 Default value: 0
Y2 Default value: 1
Z2 Default value: 0

NumPointsU Default value: 10
NumPointsV Default value: 1
DT Default value: 0.1
MaxIter Default value: 100
TimeStep Default value: 0
View Default value: -1
OtherView Default value: -1

Plugin(Summation)

Plugin(Summation) sums every time steps of 'Reference View' and (every) 'Other View X' and store the result in a new view. If 'View 0' < 0 then the current view is selected. If 'View 1...8' < 0 then this view is skipped. Views can have different number of time steps. Warning: the Plugin assume that every views share the same mesh and that meshes do not move between time steps! String options:

Resuling View Name
Default value: "default"

Numeric options:

View 0 Default value: -1
View 1 Default value: -1
View 2 Default value: -1
View 3 Default value: -1
View 4 Default value: -1
View 5 Default value: -1
View 6 Default value: -1
Plugin(Tetrahedralize)

Plugin(Tetrahedralize) tetrahedralizes the points in the view ‘View’.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Tetrahedralize) creates one new list-based view. Numeric options:

View  Default value: -1

Plugin(Transform)

Plugin(Transform) transforms the homogeneous node coordinates \((x,y,z,1)\) of the elements in the view ‘View’ by the matrix

\[
\begin{bmatrix}
A_{11} & A_{12} & A_{13} & T_x \\
A_{21} & A_{22} & A_{23} & T_y \\
A_{31} & A_{32} & A_{33} & T_z
\end{bmatrix}
\]

If ‘SwapOrientation’ is set, the orientation of the elements is reversed.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Transform) is executed in-place. Numeric options:

\[A_{11}\] Default value: 1
\[A_{12}\] Default value: 0
\[A_{13}\] Default value: 0
\[A_{21}\] Default value: 0
\[A_{22}\] Default value: 1
\[A_{23}\] Default value: 0
\[A_{31}\] Default value: 0
\[A_{32}\] Default value: 0
\[A_{33}\] Default value: 1
\[T_x\] Default value: 0
\[T_y\] Default value: 0
\[T_z\] Default value: 0
\[\text{SwapOrientation}\] Default value: 0

View  Default value: -1

Plugin(Triangulate)

Plugin(Triangulate) triangulates the points in the view ‘View’, assuming that all the points belong to a surface that can be projected one-to-one onto a plane.

If ‘View’ < 0, the plugin is run on the current view.

Plugin(Triangulate) creates one new list-based view. Numeric options:

View  Default value: -1
Plugin(VoroMetal)

Plugin(VoroMetal) creates microstructures using Voronoi diagrams.

String options:

SeedsFile
  Default value: "seeds.txt"

Numeric options:

ComputeBestSeeds
  Default value: 0

ComputeMicrostructure
  Default value: 1

Plugin(Warp)

Plugin(Warp) transforms the elements in the view ‘View’ by adding to their node coordinates the vector field stored in the ‘TimeStep’-th time step of the view ‘OtherView’, scaled by ‘Factor’.

If ‘View’ < 0, the plugin is run on the current view.

If ‘OtherView’ < 0, the vector field is taken as the field of surface normals multiplied by the ‘TimeStep’ value in ‘View’. (The smoothing of the surface normals is controlled by the ‘SmoothingAngle’ parameter.)

Plugin(Warp) is executed in-place. Numeric options:

Factor  Default value: 1

TimeStep  Default value: 0

SmoothingAngle
  Default value: 180

View  Default value: -1

OtherView  Default value: -1
10 Gmsh file formats

This chapter describes Gmsh’s native “MSH” file format, used to store meshes and associated post-processing datasets. The MSH format exists in two flavors: ASCII and binary. The format has a version number which is independent of Gmsh’s main version number.

(Remember that for small post-processing datasets you can also use human-readable “parsed” post-processing views, as described in Section 5.4 [Post-processing scripting commands], page 119. Such “parsed” views do not require an underlying mesh, and can therefore be easier to use in some cases.)

10.1 MSH file format

The MSH file format version 4 (current revision: version 4.1) contains one mandatory section giving information about the file ($MeshFormat), followed by several optional sections defining the physical group names ($PhysicalName), the elementary model entities ($Entities), the partitioned entities ($PartitionedEntities), the nodes ($Nodes), the elements ($Elements), the periodicity relations ($Periodic), the ghost elements ($GhostElements), the parametrizations ($Parametrizations) and the post-processing datasets ($NodeData, $ElementData, $ElementNodeData). The sections reflect the underlying Gmsh data model: $Entities store the boundary representation of the model geometrical entities, $Nodes and $Elements store mesh data classified on these entities, and $NodeData, $ElementData, $ElementNodeData store post-processing data (views). (See Chapter 6 [Gmsh application programming interface], page 125 and Section B.1 [Source code structure], page 377 for a more detailed description of the internal Gmsh data model.)

To represent a simple mesh, the minimal sections that should be present in the file are $MeshFormat, $Nodes and $Elements. Nodes are assumed to be defined before elements. To represent a mesh with the full topology (BRep) of the model and associated physical groups, an $Entities section should be present before the $Nodes section. Sections can be repeated in the same file, and post-processing sections can be put into separate files (e.g. one file per time step). Any section with an unrecognized header is simply ignored: you can thus add comments in a ‘.msh’ file by putting them e.g. inside a $Comments/$EndComments section.

All the node, element and entity tags (their global identification numbers) should be strictly positive. (Tag 0 is reserved for internal use.) Important note about efficiency: tags can be "sparse", i.e., do not have to constitute a continuous list of numbers (the format even allows them to not be ordered). However, using sparse tags can lead to performance degradation. For meshes, sparse indexing can¹ force Gmsh to use a map instead of a vector to access nodes and elements. The performance hit is on speed. For post-processing datasets, which always use vectors to access data, the performance hit is on memory. A $NodeData with two nodes, tagged 1 and 1000000, will allocate a (mostly empty) vector of 1000000 elements. By default, for non-partitioned, single file meshes, Gmsh will create files with a continuous ordering of node and element tags, starting at 1. Detecting if the numbering is continuous can be done easily when reading a file by inspecting numNodes, minNodeTag and maxNodeTag in the $Nodes section; and numElements, minElementTag and maxElementTag in the $Elements section.

In binary mode (Mesh.Binary=1 or -bin on the command line), all the numerical values (integer and floating point) not marked as ASCII in the format description below are written in binary form, using the type given between parentheses. The block structure of the $Nodes and $Elements sections allows to read integer and floating point data in each block in a single step (e.g. using fread in C).

The format is defined as follows:

¹ If the numbering is not too sparse, Gmsh will still use a vector.
```plaintext
$MeshFormat // same as MSH version 2
version(ASCII double; currently 4.1)
  file-type(ASCII int; 0 for ASCII mode, 1 for binary mode)
  data-size(ASCII int; sizeof(size_t))
  < int with value one; only in binary mode, to detect endianness >
$EndMeshFormat

$PhysicalNames // same as MSH version 2

In the format description above, elementType is e.g.:
1 2-node line.
2 3-node triangle.
3 4-node quadrangle.
4 4-node tetrahedron.
5 8-node hexahedron.
6 6-node prism.
7 5-node pyramid.
8 3-node second order line (2 nodes associated with the vertices and 1 with the edge).
9 6-node second order triangle (3 nodes associated with the vertices and 3 with the edges).
10 9-node second order quadrangle (4 nodes associated with the vertices, 4 with the edges and 1 with the face).
11 10-node second order tetrahedron (4 nodes associated with the vertices and 6 with the edges).
12 27-node second order hexahedron (8 nodes associated with the vertices, 12 with the edges, 6 with the faces and 1 with the volume).
13 18-node second order prism (6 nodes associated with the vertices, 9 with the edges and 3 with the quadrangular faces).
14 14-node second order pyramid (5 nodes associated with the vertices, 8 with the edges and 1 with the quadrangular face).
15 1-node point.
16 8-node second order quadrangle (4 nodes associated with the vertices and 4 with the edges).
17 20-node second order hexahedron (8 nodes associated with the vertices and 12 with the edges).
18 15-node second order prism (6 nodes associated with the vertices and 9 with the edges).
19 13-node second order pyramid (5 nodes associated with the vertices and 8 with the edges).
9-node third order incomplete triangle (3 nodes associated with the vertices, 6 with the edges)

10-node third order triangle (3 nodes associated with the vertices, 6 with the edges, 1 with the face)

12-node fourth order incomplete triangle (3 nodes associated with the vertices, 9 with the edges)

15-node fourth order triangle (3 nodes associated with the vertices, 9 with the edges, 3 with the face)

15-node fifth order incomplete triangle (3 nodes associated with the vertices, 12 with the edges)

21-node fifth order complete triangle (3 nodes associated with the vertices, 12 with the edges, 6 with the face)

4-node third order edge (2 nodes associated with the vertices, 2 internal to the edge)

5-node fourth order edge (2 nodes associated with the vertices, 3 internal to the edge)

6-node fifth order edge (2 nodes associated with the vertices, 4 internal to the edge)

20-node third order tetrahedron (4 nodes associated with the vertices, 12 with the edges, 4 with the faces)

35-node fourth order tetrahedron (4 nodes associated with the vertices, 18 with the edges, 12 with the faces, 1 in the volume)

56-node fifth order tetrahedron (4 nodes associated with the vertices, 24 with the edges, 24 with the faces, 4 in the volume)

64-node third order hexahedron (8 nodes associated with the vertices, 24 with the edges, 24 with the faces, 8 in the volume)

125-node fourth order hexahedron (8 nodes associated with the vertices, 36 with the edges, 54 with the faces, 27 in the volume)

All the currently supported elements in the format are defined in GmshDefines.h. See Section 10.2 [Node ordering], page 356 for the ordering of the nodes.

The post-processing sections (\$NodeData, \$ElementData, \$ElementNodeData) can contain numStringTags string tags, numRealTags real value tags and numIntegerTags integer tags. The default set of tags understood by Gmsh is as follows:

stringTag

The first is interpreted as the name of the post-processing view and the second as the name of the interpolation scheme, as provided in the \$InterpolationScheme section.

realTag

The first is interpreted as a time value associated with the dataset.

integerTag

The first is interpreted as a time step index (starting at 0), the second as the number of field components of the data in the view (1, 3 or 9), the third as the number of entities (nodes or elements) in the view, and the fourth as the partition index for the view data (0 for no partition).

In the \$InterpolationScheme section:
numElementTopologies

is the number of element topologies for which interpolation matrices are provided.

elementTopology

is the id tag of a given element topology: 1 for points, 2 for lines, 3 for triangles, 4 for quadrangles, 5 for tetrahedra, 6 for pyramids, 7 for prisms, 8 for hexahedra, 9 for polygons and 10 for polyhedra.

numInterpolationMatrices

is the number of interpolation matrices provided for the given element topology. Currently you should provide 2 matrices, i.e., the matrices that specify how to interpolate the data (they have the same meaning as in Section 5.4 [Post-processing scripting commands], page 119). The matrices are specified by 2 integers (numRows and numColumns) followed by the values, by row.

Here is a small example of a minimal ASCII MSH4.1 file, with a mesh consisting of two quadrangles and an associated nodal scalar dataset (the comments are not part of the actual file):

```plaintext
$MeshFormat
4.1 0 8  MSH4.1, ASCII
$EndMeshFormat
$Nodes
1 6 1 6  1 entity bloc, 6 nodes total, min/max node tags: 1 and 6
2 1 0 6  2D entity (surface) 1, no parametric coordinates, 6 nodes
  1    node tag #1
  2    node tag #2
  3    etc.
  4
  5
  6
0. 0. 0.  node #1 coordinates (0., 0., 0.)
1. 0. 0.  node #2 coordinates (1., 0., 0.)
e tc.
0. 1. 0.
2. 0. 0.
2. 1. 0.
$EndNodes
$Elements
1 2 1 2  1 entity bloc, 2 elements total, min/max element tags: 1 and 2
2 1 3 2  2D entity (surface) 1, element type 3 (4-node quad), 2 elements
  1   quad tag #1, nodes 1 2 3 4
  2   quad tag #2, nodes 2 5 6 3
$EndElements
$NodeData
1    1 string tag:
"My view"  the name of the view ("My view")
1    1 real tag:
0.0  the time value (0.0)
3    3 integer tags:
0    the time step (0; time steps always start at 0)
1    1-component (scalar) field
6    6 associated nodal values
1 0.0  value associated with node #1 (0.0)
2 0.1  value associated with node #2 (0.1)
```
3 0.2 etc.
4 0.0
5 0.2
6 0.4
$EndNodeData

The 4.1 revision of the format includes the following modifications with respect to the initial 4.0 version:

- All the unsigned long entries have been changed to size_t. All the entries designating counts which were previously encoded as int have also been changed to size_t. (This only impacts binary files.)
- The $Entities section is now optional.
- Integer and floating point data in the $Nodes section is not mixed anymore: all the tags are given first, followed by all the coordinates.
- The bounding box for point entities has been replaced simply by the 3 coordinates of the point (instead of the six bounding box values).
- The entityDim and entityTag values have been switched in the $Nodes and $Elements sections (for consistency with the ordering used elsewhere in the file and in the Chapter 6 [Gmsh application programming interface], page 125).
- The minimum and the maximum tag of nodes (resp. elements) have been added in the header of the $Nodes (resp. $Elements) section, to facilitate the detection of sparse or dense numberings when reading the file.
- The $Periodic section has been changed to always provide the number of values in the affine transform (which can be zero, if the transform is not provided).

The following changes are foreseen in a future revision of the MSH format:

- The $GhostElements, $NodeData, $ElementData and $ElementNodeData will be reworked for greater IO efficiency, with separation of entries by type and a block structure with predictable sizes.
- Node and element tags in $NodeData, $ElementData and $ElementNodeData will be switched to size_t.

### 10.2 Node ordering

Historically, Gmsh first supported linear elements (lines, triangles, quadrangles, tetrahedra, prisms and hexahedra). Then, support for second and some third order elements has been added. Below we distinguish such “low order elements”, which are hardcoded (i.e. they are explicitly defined in the code), and general “high-order elements”, that have been coded in a more general fashion, theoretically valid for any order.

#### 10.2.1 Low order elements

For all mesh and post-processing file formats, the reference elements are defined as follows.

**Line:**

```
| 0------1 ----> u 0----2----1 0---2---3---1
```

**Line3:**

```
| v
```

**Line4:**

```
^`

10.2.2 High-order elements

The node ordering of a higher order (possibly curved) element is compatible with the numbering of low order element (it is a generalization). We number nodes in the following order:

- the element principal or corner vertices;
- the internal nodes for each edge;
- the internal nodes for each face;
- the volume internal nodes.

The numbering for internal nodes is recursive, i.e. the numbering follows that of the nodes of an embedded edge/face/volume of lower order. The higher order nodes are assumed to be equispaced. Edges and faces are numbered following the lowest order template that generates a single high-order on this edge/face. Furthermore, an edge is oriented from the node with the lowest to the highest index. The orientation of a face is such that the computed normal points outward; the starting point is the node with the lowest index.

10.3 Legacy formats

This section describes Gmsh’s older native file formats. Future versions of Gmsh will continue to support these formats, but we recommend that you do not use them in new applications.

10.3.1 MSH file format version 2 (Legacy)

The MSH file format version 2 is Gmsh’s previous native mesh file format, now superseded by the format described in Section 10.1 [MSH file format], page 349. It is defined as follows:

```
$MeshFormat
version-number file-type data-size
$EndMeshFormat
$PhysicalNames
number-of-names
physical-dimension physical-tag "physical-name"
...
$EndPhysicalNames
$Nodes
```
number-of-nodes
node-number  x-coord  y-coord  z-coord
...
$EndNodes
$Elements
number-of-elements
elm-number  elm-type  number-of-tags  <  tag  >  ...  node-number-list
...
$EndElements
$Periodic
number-of-periodic-entities
<Affine  value  ...>
dimension  entity-tag  master-entity-tag
number-of-nodes
node-number  master-node-number
...
$EndPeriodic
$NodeData
number-of-string-tags
<  "string-tag"  >
...
number-of-real-tags
<  real-tag  >
...
number-of-integer-tags
<  integer-tag  >
...
node-number  value  ...
...
$EndNodeData
$ElementData
number-of-string-tags
<  "string-tag"  >
...
number-of-real-tags
<  real-tag  >
...
number-of-integer-tags
<  integer-tag  >
...
elm-number  value  ...
...
$EndElementData
$ElementNodeData
number-of-string-tags
<  "string-tag"  >
...
number-of-real-tags
<  real-tag  >
...
number-of-integer-tags
<  integer-tag  >
... 
elm-number number-of-nodes-per-element value ...
...
$EndElementNodeData
$InterpolationScheme
"name"
number-of-element-topologies
elm-topology
number-of-interpolation-matrices
num-rows num-columns value ...
...
$EndInterpolationScheme

where

version-number
    is a real number equal to 2.2

file-type
    is an integer equal to 0 in the ASCII file format.

data-size
    is an integer equal to the size of the floating point numbers used in the file (currently only data-size = sizeof(double) is supported).

number-of-nodes
    is the number of nodes in the mesh.

node-number
    is the number (index) of the n-th node in the mesh; node-number must be a positive (non-zero) integer. Note that the node-numbers do not necessarily have to form a dense nor an ordered sequence.

x-coord y-coord z-coord
    are the floating point values giving the X, Y and Z coordinates of the n-th node.

time-of-elements
    is the number of elements in the mesh.

elm-number
    is the number (index) of the n-th element in the mesh; elm-number must be a positive (non-zero) integer. Note that the elm-numbers do not necessarily have to form a dense nor an ordered sequence.

elm-type
    defines the geometrical type of the n-th element: see Section 10.1 [MSH file format], page 349.

number-of-tags
    gives the number of integer tags that follow for the n-th element. By default, the first tag is the tag of the physical entity to which the element belongs; the second is the tag of the elementary model entity to which the element belongs; the third is the number of mesh partitions to which the element belongs, followed by the partition ids (negative partition ids indicate ghost cells). A zero tag is equivalent to no tag. Gmsh and most codes using the MSH 2 format require at least the first two tags (physical and elementary tags).

node-number-list
    is the list of the node numbers of the n-th element. The ordering of the nodes is given in Section 10.2 [Node ordering], page 356.
**number-of-string-tags**
gives the number of string tags that follow. By default the first string-tag is interpreted as the name of the post-processing view and the second as the name of the interpolation scheme. The interpolation scheme is provided in the $\$\text{InterpolationScheme}$ section (see below).

**number-of-real-tags**
gives the number of real number tags that follow. By default the first real-tag is interpreted as a time value associated with the dataset.

**number-of-integer-tags**
gives the number of integer tags that follow. By default the first integer-tag is interpreted as a time step index (starting at 0), the second as the number of field components of the data in the view (1, 3 or 9), the third as the number of entities (nodes or elements) in the view, and the fourth as the partition index for the view data (0 for no partition).

**number-of-nodes-per-elements**
gives the number of node values for an element in an element-based view.

**value**
is a real number giving the value associated with a node or an element. For NodeData (respectively ElementData) views, there are $n\text{comp}$ values per node (resp. per element), where $n\text{comp}$ is the number of field components. For ElementNodeData views, there are $n\text{comp}$ times number-of-nodes-per-elements values per element.

**number-of-element-topologies**
is the number of element topologies for which interpolation matrices are provided

**elm-topology**
is the id tag of a given element topology: 1 for points, 2 for lines, 3 for triangles, 4 for quadrangles, 5 for tetrahedra, 6 for pyramids, 7 for prisms, 8 for hexahedra, 9 for polygons and 10 for polyhedra.

**number-of-interpolation-matrices**
is the number of interpolation matrices provided for the element topology $elm$-topology. Currently you should provide 2 matrices, i.e., the matrices that specify how to interpolate the data (they have the same meaning as in Section 5.4 [Post-processing scripting commands], page 119). The matrices are specified by 2 integers ($num$-rows and $num$-columns) followed by the values.

Below is a small example (a mesh consisting of two quadrangles with an associated nodal scalar dataset; the comments are not part of the actual file!):

```
$MeshFormat
2.2 0 8
$EndMeshFormat
$Nodes
6
1 0.0 0.0 0.0
2 1.0 0.0 0.0
3 1.0 1.0 0.0
4 0.0 1.0 0.0
5 2.0 0.0 0.0
6 2.0 1.0 0.0
$EndNodes
$Elements
2
```
quad #1: type 3, phys 99, ent 2, nodes 1 2 3 4
quad #2: type 3, phys 99, ent 2, nodes 2 5 6 3

one string tag:
"My view"
the name of the view ("My view")

one real tag:
0.0
the time value (0.0)

three integer tags:
0
the time step (0; time steps always start at 0)
1
1-component (scalar) field
6
six associated nodal values
1 0.0
value associated with node #1 (0.0)
2 0.1
value associated with node #2 (0.1)
3 0.2
etc.
4 0.0
5 0.2
6 0.4

The binary file format is similar to the ASCII format described above:

version-number file-type data-size
one-binary

number-of-nodes
nodes-binary

number-of-elements
elements-binary

...
one-binary

is an integer of value 1 written in binary form. This integer is used for detecting if
the computer on which the binary file was written and the computer on which the
file is read are of the same type (little or big endian).

Here is a pseudo C code to write one-binary:

```c
int one = 1;
fwrite(&one, sizeof(int), 1, file);
```

number-of-nodes

has the same meaning as in the ASCII file format.
	nodes-binary

is the list of nodes in binary form, i.e., a array of number-of-nodes * (4 + 3 * data-
size) bytes. For each node, the first 4 bytes contain the node number and the next
(3 * data-size) bytes contain the three floating point coordinates.

Here is a pseudo C code to write nodes-binary:

```c
for(i = 0; i < number_of_nodes; i++){
    fwrite(&num_i, sizeof(int), 1, file);
    double xyz[3] = {node_i_x, node_i_y, node_i_z};
    fwrite(xyz, sizeof(double), 3, file);
}
```

number-of-elements

has the same meaning as in the ASCII file format.

element-header-binary

is a list of 3 integers in binary form, i.e., an array of (3 * 4) bytes: the first four
bytes contain the type of the elements that follow (same as elm-type in the ASCII
format), the next four contain the number of elements that follow, and the last
four contain the number of tags per element (same as number-of-tags in the ASCII
format).

Here is a pseudo C code to write element-header-binary:

```c
int header[3] = {elm_type, num_elm_follow, num_tags};
fwrite(header, sizeof(int), 3, file);
```

elements-binary

is a list of elements in binary form, i.e., an array of “number of elements that follow”
* (4 + number-of-tags * 4 + #node-number-list * 4) bytes. For each element, the
first four bytes contain the element number, the next (number-of-tags * 4) contain
the tags, and the last (#node-number-list * 4) contain the node indices.

Here is a pseudo C code to write elements-binary for triangles with the 2 standard
tags (the physical group and elementary entity):

```c
for(i = 0; i < number_of_triangles; i++){
    int data[6] = {num_i, physical, elementary, 
                   node_i_1, node_i_2, node_i_3};
    fwrite(data, sizeof(int), 6, file);
}
```

10.3.2 MSH file format version 1 (Legacy)

The MSH file format version 1 is Gmsh’s original native mesh file format, now superseded by
the format described in Section 10.1 [MSH file format], page 349. It is defined as follows:

```ini
$NOD
number-of-nodes
```
node-number  x-coord  y-coord  z-coord
...
$ENDNOD
$ELM
number-of-elements
elm-number  elm-type  reg-phys  reg-elem  number-of-nodes  node-number-list
...
$ENDELM

where

number-of-nodes
is the number of nodes in the mesh.

node-number
is the number (index) of the \( n \)-th node in the mesh; node-number must be a positive (non-zero) integer. Note that the node-numbers do not necessarily have to form a dense nor an ordered sequence.

x-coord  y-coord  z-coord
are the floating point values giving the X, Y and Z coordinates of the \( n \)-th node.

number-of-elements
is the number of elements in the mesh.

elm-number
is the number (index) of the \( n \)-th element in the mesh; elm-number must be a positive (non-zero) integer. Note that the elm-numbers do not necessarily have to form a dense nor an ordered sequence.

elm-type defines the geometrical type of the \( n \)-th element:

1 2-node line.
2 3-node triangle.
3 4-node quadrangle.
4 4-node tetrahedron.
5 8-node hexahedron.
6 6-node prism.
7 5-node pyramid.
8 3-node second order line (2 nodes associated with the vertices and 1 with the edge).
9 6-node second order triangle (3 nodes associated with the vertices and 3 with the edges).
10 9-node second order quadrangle (4 nodes associated with the vertices, 4 with the edges and 1 with the face).
11 10-node second order tetrahedron (4 nodes associated with the vertices and 6 with the edges).
12 27-node second order hexahedron (8 nodes associated with the vertices, 12 with the edges, 6 with the faces and 1 with the volume).
13 18-node second order prism (6 nodes associated with the vertices, 9 with the edges and 3 with the quadrangular faces).
14-node second order pyramid (5 nodes associated with the vertices, 8 with the edges and 1 with the quadrangular face).

1-node point.

8-node second order quadrangle (4 nodes associated with the vertices and 4 with the edges).

20-node second order hexahedron (8 nodes associated with the vertices and 12 with the edges).

15-node second order prism (6 nodes associated with the vertices and 9 with the edges).

13-node second order pyramid (5 nodes associated with the vertices and 8 with the edges).

See below for the ordering of the nodes.

&reg;phys is the tag of the physical entity to which the element belongs; &reg;phys must be a positive integer, or zero. If &reg;phys is equal to zero, the element is considered not to belong to any physical entity.

&reg;elem is the tag of the elementary entity to which the element belongs; &reg;elem must be a positive (non-zero) integer.

number-of-nodes is the number of nodes for the n-th element. This is redundant, but kept for backward compatibility.

node-number-list is the list of the number-of-nodes node numbers of the n-th element. The ordering of the nodes is given in Section 10.2 [Node ordering], page 356.

### 10.3.3 POS ASCII file format (Legacy)

The POS ASCII file is Gmsh’s old native post-processing format, now superseded by the format described in Section 10.1 [MSH file format], page 349. It is defined as follows:

```
$PostFormat
1.4 file-type data-size
$EndPostFormat

$view
view-name nb-time-steps
nb-scalar-points nb-vector-points nb-tensor-points
nb-scalar-lines nb-vector-lines nb-tensor-lines

< tensor-pyramid2-value > ... 
< text2d > ... < text2d-chars > ... 
< text3d > ... < text3d-chars > ... 
\end{verbatim}
\$\texttt{EndView}$

where

\texttt{file-type}

is an integer equal to 0 in the ASCII file format.

\texttt{data-size}

is an integer equal to the size of the floating point numbers used in the file (usually, \texttt{data-size} = \texttt{sizeof(double)}).

\texttt{view-name}

is a string containing the name of the view (max. 256 characters).

\texttt{nb-time-steps}

is an integer giving the number of time steps in the view.

\texttt{nb-scalar-points}
\texttt{nb-vector-points}

... are integers giving the number of scalar points, vector points, ... , in the view.
are integers giving the number of 2D and 3D text strings in the view.

are integers giving the total number of characters in the 2D and 3D strings.

is a list of nb-time-steps double precision numbers giving the value of the time (or any other variable) for which an evolution was saved.

... are lists of double precision numbers giving the node coordinates and the values associated with the nodes of the nb-scalar-points scalar points, nb-vector-points vector points, ... for each of the time-step-values.

For example, vector-triangle-value is defined as:

```
coord1-node1 coord1-node2 coord1-node3
coord2-node1 coord2-node2 coord2-node3
coord3-node1 coord3-node2 coord3-node3
comp1-node1-time1 comp2-node1-time1 comp3-node1-time1
comp1-node2-time1 comp2-node2-time1 comp3-node2-time1
comp1-node3-time1 comp2-node3-time1 comp3-node3-time1
comp1-node1-time2 comp2-node1-time2 comp3-node1-time2
comp1-node2-time2 comp2-node2-time2 comp3-node2-time2
comp1-node3-time2 comp2-node3-time2 comp3-node3-time2
...```

The ordering of the nodes is given in Section 10.2 [Node ordering], page 356.

is a list of 4 double precision numbers:

```
coordin coord2 style index
```

where coordin and coord2 give the X-Y position of the 2D string in screen coordinates (measured from the top-left corner of the window) and where index gives the starting index of the string in text2d-chars. If coordin (respectively coord2) is negative, the position is measured from the right (respectively bottom) edge of the window. If coordin (respectively coord2) is larger than 99999, the string is centered horizontally (respectively vertically). If style is equal to zero, the text is aligned bottom-left and displayed using the default font and size. Otherwise, style is converted into an integer whose eight lower bits give the font size, whose eight next bits select the font (the index corresponds to the position in the font menu in the GUI), and whose eight next bits define the text alignment (0=bottom-left, 1=bottom-center, 2=bottom-right, 3=top-left, 4=top-center, 5=top-right, 6=cente-center, 7=center-center, 8=center-right).

is a list of nb-text2d-chars characters. Substrings are separated with the null ‘\0’ character.

is a list of 5 double precision numbers

```
coordin coordin coordin style index
```

where coordin, coord2 and coordin give the XYZ coordinates of the string in model (real world) coordinates, index gives the starting index of the string in text3d-chars, and style has the same meaning as in text2d.
text3d-chars

is a list of nb-text3d-chars chars. Substrings are separated with the null ‘\0’ character.

10.3.4 POS binary file format (Legacy)

The POS binary file format is the same as the POS ASCII file format described in Section 10.3.3 [POS ASCII file format (Legacy)], page 367, except that:

1. file-type equals 1.
2. all lists of floating point numbers and characters are written in binary format
3. there is an additional integer, of value 1, written before time-step-values. This integer is used for detecting if the computer on which the binary file was written and the computer on which the file is read are of the same type (little or big endian).

Here is a pseudo C code to write a post-processing file in binary format:

```c
int one = 1;

fprintf(file, "$PostFormat\n");
fprintf(file, "$%g %d %d\n", 1.4, 1, sizeof(double));
fprintf(file, "$EndPostFormat\n");
fprintf(file, "$View\n");
fprintf(file, "$%s %d "$ %d %d %d %d %d %d %d %d %d %d %d %d %d %d %d %d %d %d %d %d

fwrite(&one, sizeof(int), 1, file);
fwrite(time-step-values, sizeof(double), nb-time-steps, file);
fwrite(all-scalar-point-values, sizeof(double), ..., file);
...

fprintf(file, "$EndView\n");
```
In this pseudo-code, _all-scalar-point-values_ is the array of double precision numbers containing all the _scalar-point-value_ lists, put one after each other in order to form a long array of doubles. The principle is the same for all other kinds of values.
Appendix A Compiling the source code

Stable releases and source snapshots are available from https://gmsh.info/src/. You can also access the Git repository directly:

1. The first time you want to download the latest full source, type:
   
   ```
   git clone https://gitlab.onelab.info/gmsh/gmsh.git
   ```

2. To update your local version to the latest and greatest, go in the gmsh directory and type:
   
   ```
   git pull
   ```

Once you have the source code, you need to run CMake to configure your build (see the README.txt file in the top-level source directory for additional information on how to run CMake, as well as the Gmsh-compilation wiki page for more detailed instructions on how to compile Gmsh, including the compilation of common dependencies).

Each build can be configured using a series of options, to selectively enable optional modules or features. Here is the list of all the Gmsh-specific CMake options:

**ENABLE_3M**
Enable proprietary 3M extension (default: OFF)

**ENABLE_ALGLIB**
Enable ALGLIB (used by some mesh optimizers) (default: ON)

**ENABLE_ANN**
Enable ANN (used for fast point search in mesh/post) (default: ON)

**ENABLE_BAMG**
Enable Bamg 2D anisotropic mesh generator (default: ON)

**ENABLE_BLAS_LAPACK**
Enable BLAS/Lapack for linear algebra (if Eigen if disabled) (default: OFF)

**ENABLE_BLOSSOM**
Enable Blossom algorithm (needed for full quad meshing) (default: ON)

**ENABLE_BUILD_LIB**
Enable 'lib' target for building static Gmsh library (default: OFF)

**ENABLE_BUILD_SHARED**
Enable 'shared' target for building shared Gmsh library (default: OFF)

**ENABLE_BUILD_DYNAMIC**
Enable dynamic Gmsh executable (linked with shared library) (default: OFF)

**ENABLE_BUILD_ANDROID**
Enable Android NDK library target (experimental) (default: OFF)

**ENABLE_BUILD_IOS**
Enable iOS library target (experimental) (default: OFF)

**ENABLE_CGNS**
Enable CGNS import/export (experimental) (default: ON)

**ENABLE_CGNS_CPEX0045**
Enable high-order CGNS import/export following CPEX0045 (experimental) (default: OFF)

**ENABLE_CAIRO**
Enable Cairo to render fonts (experimental) (default: ON)
ENABLE_PROFILE
    Enable profiling compiler flags (default: OFF)

ENABLE_DINTEGRATION
    Enable discrete integration (needed for levelsets) (default: ON)

ENABLE_DOMHEX
    Enable experimental DOMHEX code (default: ON)

ENABLE_EIGEN
    Enable Eigen for linear algebra (instead of Blas/Lapack) (default: ON)

ENABLE_FLTK
    Enable FLTK graphical user interface (requires mesh/post) (default: ON)

ENABLE_GEOMETRYCENTRAL
    Enable geometry-central library (experimental) (default: ON)

ENABLE_GETDP
    Enable GetDP solver (linked as a library, experimental) (default: ON)

ENABLE_GMM
    Enable GMM linear solvers (simple alternative to PETSc) (default: ON)

ENABLE_GMP
    Enable GMP for Kbipack (advanced) (default: ON)

ENABLE_GRAPHICS
    Enable building graphics lib even without GUI (advanced) (default: OFF)

ENABLE_HXT
    Enable HXT library (for reparametrization and meshing) (default: ON)

ENABLE_KBIPACK
    Enable Kbipack (needed by homology solver) (default: ON)

ENABLE_MATHEX
    Enable Mathex expression parser (used by plugins and options) (default: ON)

ENABLE_MED
    Enable MED mesh and post file formats (default: ON)

ENABLE_MESH
    Enable mesh module (default: ON)

ENABLE_METIS
    Enable Metis mesh partitioner (default: ON)

ENABLE_MMG
    Enable Mmg mesh adaptation interface (default: ON)

ENABLE_MPEG_ENCODE
    Enable built-in MPEG movie encoder (default: ON)

ENABLE_MPI
    Enable MPI (experimental, not used for meshing) (default: OFF)

ENABLE_MSVCC_STATIC_RUNTIME
    Enable static Visual C++ runtime (default: OFF)

ENABLE_MUMPS
    Enable MUMPS sparse direct linear solver (default: OFF)
ENABLE_NETGEN
Enable Netgen 3D frontal mesh generator (default: ON)

ENABLE_NUMPY
Enable fullMatrix and numpy array conversion for private API (default: OFF)

ENABLE_PETSC4PY
Enable petsc4py wrappers for petsc matrices for private API (default: OFF)

ENABLE_OCC
Enable OpenCASCADE CAD kernel (default: ON)

ENABLE_OCC_CAF
Enable OpenCASCADE CAF module (for STEP/IGES attributes) (default: ON)

ENABLE_OCC_STATIC
Link OpenCASCADE static instead of dynamic libraries (requires ENABLE_OCC) (default: OFF)

ENABLE_OCC_TBB
Add TBB libraries in list of OCC libraries (default: OFF)

ENABLE_ONELAB
Enable ONELAB solver interface (default: ON)

ENABLE_ONELAB_METAMODEL
Enable ONELAB metamodels (experimental) (default: ON)

ENABLE_OPENACC
Enable OpenACC (default: OFF)

ENABLE_OPENMP
Enable OpenMP (default: ON)

ENABLE_OPTHOM
Enable high-order mesh optimization tools (default: ON)

ENABLE_OS_SPECIFIC_INSTALL
Enable OS-specific (e.g. app bundle) installation (default: OFF)

ENABLE_OSMESA
Enable OSMesa for offscreen rendering (experimental) (default: OFF)

ENABLE_P4EST
Enable p4est for enabling automatic mesh size field (experimental) (default: OFF)

ENABLE_PACKAGE_STRIP
Strip symbols in install packages to reduce install size (default: ON)

ENABLE_PARSER
Enable GEO file parser (required for .geo/.pos scripts) (default: ON)

ENABLE_PETSC
Enable PETSc linear solvers (required for SLEPc) (default: OFF)

ENABLE_PLUGINS
Enable post-processing plugins (default: ON)

ENABLE_POST
Enable post-processing module (required by GUI) (default: ON)

ENABLE_POPPLER
Enable Poppler for displaying PDF documents (experimental) (default: OFF)
ENABLE_PRIVATE_API
    Enable private API (default: OFF)
ENABLE_PRO
    Enable PRO extensions (default: ON)
ENABLE_QUADMESHINGTOOLS
    Enable QuadMeshingTools extensions (default: ON)
ENABLE_QUADTRI
    Enable QuadTri structured meshing extensions (default: ON)
ENABLE_REVOROPT
    Enable Revoropt (used for CVT remeshing) (default: OFF)
ENABLE_RPATH
    Use RPATH in dynamically linked targets (default: ON)
ENABLE_SLEPC
    Enable SLEPc eigensolvers (default: OFF)
ENABLE_SOLVER
    Enable built-in finite element solvers (required for reparametrization) (default: ON)
ENABLE_SYSTEM_CONTRIB
    Use system versions of contrib libraries, when possible (default: OFF)
ENABLE_TCMALLOC
    Enable libtcmalloc (fast malloc that does not release memory) (default: OFF)
ENABLE_TESTS
    Enable tests (default: ON)
ENABLE_TOUCHBAR
    Enable Apple Touch bar (default: ON)
ENABLE_VISUDEV
    Enable additional visualization capabilities for development purposes (default: OFF)
ENABLE_VOROPP
    Enable voro++ (for hex meshing, experimental) (default: ON)
ENABLE_WINSLOWUNTANGLER
    Enable WinslowUntangler extensions (requires ALGLIB) (default: ON)
ENABLE_WRAP_JAVA
    Generate SWIG Java wrappers for private API (default: OFF)
ENABLE_WRAP_PYTHON
    Generate SWIG Python wrappers for private API (not used by public API) (default: OFF)
ENABLE ZIPPER
    Enable Zip file compression/decompression (default: OFF)
Appendix B  Information for developers

Gmsh is written in C++, the scripting language is parsed using Lex and Yacc (actually, Flex and Bison), and the GUI relies on OpenGL for the 3D graphics and FLTK (http://www.fltk.org) for the widgets (menus, buttons, etc.). Gmsh’s build system is based on CMake (http://www.cmake.org). Practical notes on how to compile Gmsh’s source code are provided in Appendix A [Compiling the source code], page 373 (see also Appendix C [Frequently asked questions], page 379).

This section is for developers who would like to contribute directly to the Gmsh source code. Gmsh’s official Git repository is located at https://gitlab.onelab.info/gmsh/gmsh. The wiki (https://gitlab.onelab.info/gmsh/gmsh/wikis/Git-cheat-sheet) contains instructions on how to create feature branches and submit merge requests.

B.1 Source code structure

Gmsh’s code is structured in several subdirectories, roughly separated between the four core modules (src/geo, src/mesh, src/solver, src/post) and associated utilities (src/common, src/numeric) on one hand, and the graphics (src/graphics) and interface (src/fltk, src/parser, api) code on the other.

The geometry module is based on a model class (src/geo/GModel.h), and abstract entity classes for geometrical points (src/geo/GVertex.h), curves (src/geo/GEdge.h), surfaces (src/geo/GFace.h) and volumes (src/geo/GRegion.h). Concrete implementations of these classes are provided for each supported CAD kernel (e.g. src/geo/gmshVertex.h for points in Gmsh’s built-in CAD kernel, or src/geo/OCCVertex.h for points from OpenCASCADE). All these elementary model entities derive from src/geo/GEntity.h. Physical groups are simply stored as integer tags in the entities.

A mesh is composed of elements: mesh points (src/geo/MPoint.h), lines (src/geo/MLine.h), triangles (src/geo/MTriangle.h), quadrangles (src/geo/MQuadrangle.h), tetrahedra (src/geo/MTetrahedron.h), etc. All the mesh elements are derived from src/geo/MElement.h, and are stored in the corresponding model entities: one mesh point per geometrical point, mesh lines in geometrical curves, triangles and quadrangles in surfaces, etc. The elements are defined in terms of their nodes (src/geo/MVertex.h). Each model entity stores only its internal nodes: nodes on boundaries or on embedded entities are stored in the associated bounding/embedded entity.

The post-processing module is based on the concept of views (src/post/PView.h) and abstract data containers (derived from src/post/PViewData.h). Data can be either mesh-based (src/post/PViewDataGModel.h), in which case the view is linked to one or more models, or list-based (src/post/PViewDataList.h), in which case all the relevant geometrical information is self-contained in the view.

B.2 Coding style

If you plan to contribute code to the Gmsh project, here are some easy rules to make the code easy to read/debug/maintain:

• See https://gitlab.onelab.info/gmsh/gmsh/wikis/Git-cheat-sheet for instructions on how to contribute to Gmsh’s Git source code repository. All branches are tested; make sure that all tests pass and that your code does not produce any warnings before submitting merge requests.

• Follow the style used in the existing code when adding something new: indent using 2 spaces (never use tabs!), put 1 space after commas, put opening braces for functions on a separate line, opening braces for loops and tests on the same line, etc. You can use the clang-format tool to apply these rules automatically (the rules are defined in the .clang-format file.)
• Always use the `Msg::` class to print information or errors
• Use memory checking tools to detect memory leaks and other nasty memory problems. For example, on Linux you can use `valgrind --leak-check=full gmsh file.geo -3`.

B.3 Adding a new option

To add a new option in Gmsh:

1. create the option in the `CTX` class (`src/common/Context.h` if it’s a classical option, or in the `PViewOptions` class (`src/post/PViewOptions.h`) if it’s a post-processing view-dependent option;
2. in `src/common/DefaultOptions.h`, give a name (for the parser to be able to access it), a reference to a handling routine (i.e. `opt_XXX`) and a default value for this option;
3. create the handling routine `opt_XXX` in `src/common/Options.cpp` (and add the prototype in `src/common/Options.h`);
4. optional: create the associated widget in `src/fltk/optionWindow.h`;
Appendix C Frequently asked questions

C.1 The basics

1. What is Gmsh?
   Gmsh is an automatic three-dimensional finite element mesh generator with built-in pre- and
   post-processing facilities. With Gmsh you can create or import 1D, 2D and 3D geometrical
   models, mesh them, launch external finite element solvers and visualize solutions. Gmsh
   can be used either as a stand-alone program (graphical or not) or as a library to integrate
   in C++, C, Python, Julia or Fortran codes.

2. What are the terms and conditions of use?
   Gmsh is distributed under the terms of the GNU General Public License, with an exception
   to allow for easier linking with external libraries. See Appendix F [License], page 413 for
   more information.

3. What does ‘Gmsh’ mean?
   Nothing... The name was derived from a previous version called “msh” (a shortcut for
   “mesh”), with the “g” prefix added to differentiate it. The default mesh file format used
   by Gmsh still uses the ‘.msh’ extension.
   In English people tend to pronounce ‘Gmsh’ as “gee-mesh”.

4. Can I embed ‘Gmsh’ in my own software?
   Yes, using the Gmsh API (see Chapter 6 [Gmsh application programming interface],
   page 125). See [Copying conditions], page 3 for the licensing constraints.

5. Where can I find more information?
   https://gmsh.info is the primary location to obtain information about Gmsh. There you
   will for example find the complete reference manual and the bug tracking database.

C.2 Installation problems

1. Which OSes does Gmsh run on?
   Gmsh runs on Windows, macOS, Linux and most Unix variants. Gmsh is also available as
   part of the ONELAB package on Android and iOS tablets and phones.

2. Are there additional requirements to run Gmsh?
   You should have the OpenGL libraries installed on your system, and in the path of the
   library loader. A free replacement for OpenGL can be found at http://www.mesa3d.org.

3. How do I compile Gmsh from the source code?
   You need cmake (http://www.cmake.org) and a C++ compiler. See Appendix A [Compiling
   the source code], page 373 for more information.

4. Where does Gmsh save its configuration files?
   Gmsh will attempt to save temporary files and persistent configuration options first in the
   $GMSH_HOME directory, then in $APPDATA (on Windows) or $HOME (on other OSes), then in
   $TMP, and finally in $TEMP, in that order. If none of these variables are defined, Gmsh will
   try to save/load its configuration files from the current working directory.

C.3 General questions

1. Gmsh (from a binary distribution) complains about missing libraries.
   On Windows, if your system complains about missing ‘OPENGL32.DLL’ or ‘GLU32.DLL’ li-
   braries, then OpenGL is not properly installed on your machine. You can download OpenGL
   from Microsoft’s web site, or directly from http://www.opengl.org.
On Unix try ‘ldd gmsh’ (or ‘tool -L gmsh’ on macOS) to check if all the required shared libraries are installed on your system. If not, install them. If it still doesn’t work, recompile Gmsh from the source code.

2. Gmsh keeps re-displaying its graphics when other windows partially hide the graphical window.
Disable opaque move in your window manager.

3. The graphics display very slowly.
Are you are executing Gmsh from a remote host (via the network) without GLX? You should turn double buffering off (with the ‘-nodb’ command-line switch).

4. There is an ugly “ghost triangulation” in the vector PostScript/PDF files generated by Gmsh!
No, there isn’t. This “ghost triangulation” is due to the fact that most PostScript previewers nowadays antialias the graphic primitives when they display the page on screen. (For example, in gv, you can disable antialiasing with the ‘State->Antialias’ menu.) You should not see this ghost triangulation in the printed output (on paper).

5. How can I save GIF, JPEG, ..., images?
Just choose the appropriate format in ‘File->Export’. By default Gmsh guesses the format from the file extension, so you can just type ‘myfile.jpg’ in the dialog and Gmsh will automatically create a JPEG image file.

6. How save high-resolution images?
You can specify the dimension in the dialog (e.g. set the width of the image to 5000 pixels; leaving one dimension negative will rescale using the natural aspect ratio), or through the \texttt{Print.Width} and \texttt{Print.Height} options. The maximum image size is graphics hardware dependent.

7. How can I save MPEG, AVI, ..., animations?
You can create simple MPEG animations by choosing MPEG as the format in ‘File->Export’: this allows you to loop over time steps or post-processing data sets, or to change parameters according to \texttt{Print.Parameter}. To create fully customized animations or to use different output formats (AVI, MP4, etc.) you should write a script. Have a look at Section 2.8 \cite{t8}, page 33 or \texttt{examples/post-processing/anim.script} for some examples.

8. Can I change values in input fields with the mouse in the GUI?
Yes: dragging the mouse in a numeric input field slides the value! The left button moves one step per pixel, the middle by ‘10*step’, and the right button by ‘100*step’.

9. Can I copy messages to the clipboard?
Yes: selecting the content of an input field, or lines in the message console (‘Tools->Message Console’), copies the selected text to the clipboard.

10. Graphical rendering or entity selection is very slow on Linux.
The issue is most probably linked with your graphics card driver. Try setting the environment variable \texttt{LIBGL_ALWAYS_SOFTWARE=true} to force software rendering.

C.4 Geometry module

1. Does Gmsh support trimmed NURBS surfaces?
Yes, but only with the OpenCASCADE kernel.

2. Gmsh is very slow when I use many transformations (Translate, Rotate, Symmetry, Extrude, etc.) with the built-in CAD kernel. What’s wrong?
The default behavior of Gmsh is to check and suppress all duplicate entities (points, curves and surfaces) each time a transformation command is issued with the built-in CAD kernel.
This can slow down things a lot if many transformations are performed. There are two solutions to this problem:

- you may save the serialized ("unrolled") geometry in another file (using `gmsh file.geo -0` or exporting to "geo_unrolled"), and use this new file for subsequent computations;
- or you may set the `Geometry.AutoCoherence` option to 0. This will prevent any automatic duplicate check/replacement. If you still need to remove the duplicates entities, simply add `Coherence;` at strategic locations in your `.geo` files (e.g. before the creation of curve loops, etc.).

3. Why is my "geo_unrolled" file incomplete?

"Unrolled GEO" files can only fully represent geometries created with the built-in geometry kernel. If you want to serialize a geometry created with the OpenCASCADE geometry kernel, you should use the native OpenCASCADE ".brep" format.

4. How can I display only selected parts of my model?

Use ‘Tools->Visibility’. This allows you to select elementary entities and physical groups, as well as mesh elements, in a variety of ways (in a list or tree browser, by tag, interactively, or per window).

5. Can I edit STEP/IGES/BRep models?

Yes: with the OpenCASCADE kernel (`SetFactory("OpenCASCADE");`), load the file (`Merge "file.step";` or `ShapeFromFile("file.step");`) and add the relevant scripting commands after that to delete parts, create new parts or apply boolean operators. See e.g. `examples/boolean/import.geo`.

6. Why are there surfaces missing when I export a STEP as an unrolled `.geo` file?

You should not export STEP models as `.geo` files. By design, Gmsh never translates from one CAD format to another. The "unrolled GEO" feature is there for unrolling complex GEO scripts writted with the built-in geometry kernel. While it can indeed export a limited subset of geometrical entities created by other CAD kernels (e.g. OpenCASCADE), this feature is available for debugging purposes.

7. How can I build modular geometries?

Define common geometrical objects and options in separate files or using `Macro`, reusable in all your problem definition structures. Or use the features of your language of choice and the Gmsh API.

8. Some files take much more time to load with Gmsh 4 compared to Gmsh 3: what’s happening?

In Gmsh 4, some operations (Color, Show, Hide, BoundingBox, Boundary, PointsOf, Periodic, In embedding constraints, ..) are now applied directly on the internal Gmsh model, instead of being handled at the level of the CAD kernel. This implies a synchronization between the CAD kernel and the Gmsh model. To minimize the number of synchronizations (which can become costly for large models), you should always create your geometry first; and use these commands once the geometry has been created.

### C.5 Mesh module

1. What should I do when the 2D unstructured algorithm fails?

Verify that the curves in the model do not self-intersect. If `Mesh.RandomFactor * size of triangle / size of model` approaches machine accuracy, increase `Mesh.RandomFactor`.

If everything fails file a bug report with the version of your operating system and the full geometry.
2. What should I do when the 3D unstructured algorithm fails?

Verify that the surfaces in your model do not self-intersect or partially overlap. If they
don’t, try the other 3D algorithms (‘Tool->Options->Mesh->General->3D algorithm’) or try
to adapt the mesh element sizes in your input file so that the surface mesh better matches
the geometrical details of the model.

If nothing works, file a bug report with the version of your operating system and the full
geometry.

3. How can I only save tetrahedral elements (not triangles and lines)?

By default, if physical groups are defined, the output mesh only contains those elements
that belong to physical entities. So to save only 3D elements, simply define one (or more)
physical volume(s) and don’t define any physical surfaces, physical curves or physical points.

4. How can I remove mesh nodes for geometrical construction points (centers of spheres, etc.)
from output mesh file?

By default Gmsh saves all the geometrical entities and their associated mesh. In particular,
since each geometry point is meshed with a point element, defined by a mesh node, the
output file will contain one 0-D mesh element and one mesh node for each geometry point.
To remove such elements/nodes from the mesh, simply define physical groups for the entities
you want to save (see previous question).

5. My 2D meshes of IGES files present gaps between surfaces

IGES files do not contain the topology of the model, and tolerance problems can thus
appear when the OpenCASCADE importer cannot identify two (close) curves as actually
being identical.

The best solution is to not use IGES and use STEP instead. If you really have to use
IGES, check that you don’t have duplicate curves (e.g. by displaying their tags in the
GUI with ‘Tools->Options->Geometry->Visibility->Curve labels’). If there are duplicates,
try to change the geometrical tolerance and sew the faces (see options in ‘Tools->Options->
Geometry->General’).

6. The quality of the elements generated by the 3D algorithm is very bad.

Use ‘Optimize quality’ in the mesh menu.

7. Non-recombined 3D extruded meshes sometimes fail.

The swapping algorithm is not very clever. Try to change the surface mesh a bit, or
recombine your mesh to generate prisms or hexahedra instead of tetrahedra.

8. Does Gmsh automatically couple unstructured tetrahedral meshes and structured hexahedr-

ral meshed using pyramids?

Yes, but only if pyramids need to be created on a single side of the quadrangular surface
mesh.

9. Can I explicitly assign region tags to extruded layers?

No, this feature has been removed in Gmsh 2.0. You must use the standard entity tag
instead.

10. Did you remove the elliptic mesh generator in Gmsh 2.0?

Yes. You can achieve the same result by using the transfinite algorithm with smoothing
(e.g., with Mesh.Smoothing = 10).

11. Does Gmsh support curved elements?

Yes, just choose the appropriate order in the mesh menu after the mesh is completed.
High-order optimization tools are also available in the mesh menu. You can select the
order on the command line with e.g. -order 2, and activate high-order optimization with
-optimize_ho.
12. Can I import an existing surface mesh in Gmsh and use it to build a 3D mesh?
Yes, you can import a surface mesh in any one of the supported mesh file formats, define a volume, and mesh it. For an example see examples/simple.geo/sphere-discrete.geo.

13. How do I define boundary conditions or material properties in Gmsh?
By design, Gmsh does not try to incorporate every possible definition of boundary conditions or material properties—this is a job best left to the solver. Instead, Gmsh provides a simple mechanism to tag groups of elements, and it is up to the solver to interpret these tags as boundary conditions, materials, etc. Associating tags with elements in Gmsh is done by defining physical groups (Physical Points, Physical Curves, Physical Surfaces and Physical Volumes). See the reference manual as well as the tutorials (in particular Section 2.1 [t1], page 15) for a detailed description and some examples.

The Gmsh API can be used to build sophisticated interactive workflows where the definition of boundary conditions and material properties can be fully tailored to your preferred solver. For an example see examples/api/prepro.py.

14. How can I display only the mesh associated with selected geometrical entities?
See “How can I display only selected parts of my model?”.

15. How can I “explore” a mesh (for example, to see inside a complex structure)?
You can use ‘Tools->Clipping’ to clip the region of interest. You can define up to 6 clipping planes in Gmsh (i.e., enough to define a “cube” inside your model) and each plane can clip either the geometry, the mesh, the post-processing views, or any combination of the above. The clipping planes are defined using the four coefficients A,B,C,D of the equation $A\times x+B\times y+C\times y+D=0$, which can be adjusted interactively by dragging the mouse in the input fields.

16. What is the signification of SICN, Gamma and SIGE in Tools->Statistics?
They measure the quality of the tetrahedra in a mesh:

- SICN: signed inverse condition number
- Gamma: inscribed radius / circumscribed radius
- SIGE: signed inverse error on the gradient of FE solution

For the exact definitions, see src/geo/MElement.cpp. The graphs plot the the number of elements vs. the quality measure.

17. How can I save a mesh file with a given (e.g. older) MSH file format version?
- In the GUI: open ‘File->Export’, enter your ‘filename.msh’ and then pick the version in the dropdown menu.
- On the command line: use the -format option (e.g. gmsh file.geo -format msh2 -2).
- In a ‘.geo’ script: add the line Mesh.MshFileVersion = x.y; for any version number x.y. You can also save this in your default options.
- In the API: gmsh::option::setNumber("Mesh.MshFileVersion", x.y).

As an alternative method, you can also not specify the format explicitly, and just choose a filename with the .msh2 or .msh4 extension.

18. Why isn’t neighboring element information stored in the MSH file?
Each numerical method has its own requirements: it might need neighboring elements connected by a node, an edge or a face; it might require a single layer or multiple layers; it should include elements of lower dimension (boundaries) or not, go across geometrical entities or mesh partitions or not, etc. Given the number of possibilities, generating the appropriate information is thus best performed in the numerical solver itself. The Gmsh API makes these computations easy: see tutorial Section 2.28 [x7], page 75 and examples/api/neighors.py.
19. Could mesh edges/faces be stored in the MSH file?

   Edge/faces can be easily generated from the information already available in the file (i.e. nodes and elements), or through the Gmsh API: see tutorial Section 2.28 [7], page 75, examples/api/edges.cpp and examples/api/faces.cpp.

C.6 Solver module

1. How do I integrate my own solver with Gmsh?

   Gmsh uses the ONELAB interface (http://www.onelab.info) to interact with external solvers. See Section 1.3 [Solver module], page 12.

2. Can I launch Gmsh from my solver (instead of launching my solver from Gmsh) in order to monitor a solution?

   Using the Gmsh API, you can directly embed Gmsh in your own solver, use ONELAB for interactive parameter definition and modification, and create visualization data on the fly. See e.g. prepro.py, custom_gui.py, custom_gui.cpp.

   Another (rather crude) approach if to launch the Gmsh app everytime you want to visualize something (a simple C program showing how to do this is given in utils/misc/callgmsh.c).

   Yet another approach is to modify your program so that it can communicate with Gmsh through ONELAB over a socket. Select ‘Always listen to incoming connection requests’ in the Gmsh solver option panel (or run gmsh with the -listen command line switch), and Gmsh will always listen for your program on the given socket (or on the Solver.SocketName if no socket is specified).

C.7 Post-processing module

1. How do I compute a section of a plot?
   Use ‘Tools->Plugins->Cut Plane’.

2. Can I save an isosurface to a file?
   Yes: first run ‘Tools->Plugins->Isosurface’ to extract the isosurface, then use ‘View->Export’ to save the new view.

3. Can Gmsh generate isovolumes?
   Yes, with the CutMap plugin (set the ExtractVolume option to -1 or 1 to extract the negative or positive levelset).

4. How do I animate my plots?
   If the views contain multiple time steps, you can press the ‘play’ button at the bottom of the graphic window, or change the time step by hand in the view option panel. You can also use the left and right arrow keys on your keyboard to change the time step in all visible views in real time.

   If you want to loop through different views instead of time steps, you can use the ‘Loop through views instead of time steps’ option in the view option panel, or use the up and down arrow keys on your keyboard.

5. How do I visualize a deformed mesh?
   Load a vector view containing the displacement field, and set ‘Vector display’ to ‘Displacement’ in ‘View->Options->Aspect’. If the displacement is too small (or too large), you can scale it with the ‘Displacement factor’ option. (Remember that you can drag the mouse in all numeric input fields to slide the value!)

   Another option is to use the ‘General transformation expressions’ (in View->Options->Offset) on a scalar view, with the displacement map selected as the data source.
6. Can I visualize a field on a deformed mesh?
Yes, there are several ways to do that.
The easiest is to load two views: the first one containing a displacement field (a vector view that will be used to deform the mesh), and the second one containing the field you want to display (this view has to contain the same number of elements as the displacement view). You should then set ‘Vector display’ to ‘Displacement’ in the first view, as well as set ‘Data source’ to point to the second view. (You might want to make the second view invisible, too. If you want to amplify or decrease the amount of deformation, just modify the ‘Displacement factor’ option.)

Another solution is to use the ‘General transformation expressions’ (in ‘View->Options->Offset’) on the field you want to display, with the displacement map selected as the data source.

And yet another solution is to use the Warp plugin.

7. Can I color the arrows representing a vector field with data from a scalar field?
Yes: load both the vector and the scalar fields (the two views must have the same number of elements) and, in the vector field options, select the scalar view in ‘Data source’.

8. Can I color isovalue surfaces with data from another scalar view?
Yes, using either the CutMap plugin (with the ‘dView’ option) or the Evaluate plugin.

9. Is there a way to save animations?
You can save simple MPEG animations directly from the ‘File->Export’ menu. For other formats you should write a script. Have a look at Section 2.8 [t8], page 33 or examples/post-processing/anim.script for some examples.

10. Is there a way to visualize only certain components of vector/tensor fields?

11. Can I do arithmetic operations on a view? Can I perform operations involving different views?
Yes, with the Evaluate plugin.

12. Some plugins seem to create empty views. What’s wrong?
There can be several reasons:
• the plugin might be written for specific element types only (for example, only for scalar triangles or tetrahedra). In that case, you should transform your view before running the plugin (you can use Plugin(DecomposeinSimplex) to transform all quads, hexas, prisms and pyramids into triangles and tetrahedra).
• the plugin might expect a mesh while all you provide is a point cloud. In 2D, you can use Plugin(Triangulate) to transform a point cloud into a triangulated surface. In 3D you can use Plugin(Tetrahedralize).
• the input parameters are out of range.

In any case, you can automatically remove all empty views with ‘View->Remove->Empty Views’ in the GUI, or with Delete Empty Views; in a script.

13. How can I see “inside” a complicated post-processing view?
Use ‘Tools->Clipping’.
When viewing 3D scalar fields, you can also modify the colormap (‘Tools->Options->View->Map’) to make the iso-surfaces “transparent”: either by holding Ctrl while dragging the mouse to draw the alpha channel by hand, or by using the a, Ctrl+a, p and Ctrl+p keyboard shortcuts.
Yet another (destructive) option is to use the ExtractVolume option in the CutSphere or CutPlane plugins.

14. I am loading a valid 3D scalar view but Gmsh does not display anything!
If your dataset is constant per element make sure you don’t use the ‘Iso-values’ interval type in ‘Tools->Options->View->Range’.
Appendix D  Version history

4.12 (Work-in-progress): new high-order mesh optimisation mode for periodic meshes; new element qualities available through API; new IGES export; new volume glyph; OCC curve loops can now be oriented based on the sign of the first curve; better mesh node visualization; added support for model attributes in MSH2 files; new mesh renumbering capabilities in the API; replaced Geometry.OCCSafeUnbind with more flexible Geometry.OCCFastUnbind (which can be set for boolean operations as well); small bug fixes.

* New API functions: model/getEntitiesForPhysicalName, mesh/computeRenumbering, mesh/getVisibility.

* Incompatible API changes: new optional argument to occ/addCircleArc, mesh/renumberNodes, mesh/renumberElements and view/getListData; new optional "interruptible" argument to gmsh.initialize() in Python

4.11.0 (November 6, 2022): new Fortran API; improved copying ("Duplicata") of multiple shapes with OCC; reduced default order for OCC surface filling; arbitrary string attributes can now be stored in models and MSH files; new Radioss export; added ability to specify spline tangents with OCC; new option Mesh.SaveWithoutOrphans to prune orphan entities (e.g. geometrical construction points) from MSH4 files; major overhaul of the reference manual; new official macOS ARM builds; small bug fixes.

* New API functions: model/getAttributeNames, model/getAttribute, model/setAttribute, model/removeAttribute

* Incompatible API changes: new argument to mesh/computeHomology; new optional arguments to occ/addSpline and occ/addThruSections

4.10.5 (July 1, 2022): small bug fixes.

4.10.4 (June 19, 2022): improved graphical window tooltips; small bug fixes.

* New API function: mesh/removeDuplicateElements

4.10.3 (May 26, 2022): small bug fixes.

* New API function: fltk/finalize

4.10.2 (May 13, 2022): fixed regression introduced in 4.9 for recombined meshes with boundary layers; new Geometry.OCCSafeUnbind option to disable boolean optimization introduced in 4.10.0 (for backward compatibility); new HealShapes command in .geo files; simplified calculation of OCC STL bounding boxes; generalized Crack plugin; small bug fixes.

4.10.1 (May 1, 2022): small bug fixes.

4.10.0 (April 25, 2022): more flexible homology/cohomology workflow in the API;
"Attractor" field is now just a synonym for the newer (and more efficient) "Distance" field; periodic bsplines now use the same default multiplicities in OCC as in the built-in kernel; model/isInside now also handles discrete entities; speed-up repeated simple boolean operations; C++ api now throws std::runtime_error on errors; small bug fixes.

* New API functions: geo/addGeometry, geo/addPointOnGeometry, mesh/addHomologyRequest, mesh/clearHomologyRequests, mesh/setVisibility, mesh/getElementQualities

* Incompatible API changes: additional const qualifiers in C API; removed mesh/computeCohomology; new arguments to occ/getCurveLoops and occ/getSurfaceLoops; changed arguments of mesh/computeHomology; new optional arguments to occ/addCircle, occ/addEllipse, occ/addDisk, occ/addTorus, occ/addWedge, model/addPhysicalGroup, model/geo/addPhysicalGroup, mesh/removeDuplicateNodes and mesh/setRecombine.

4.9.5 (February 21, 2022): dynamic Gmsh library now also only exports public symbols on macOS and Linux, like it does on Windows; better handling of max. thread settings; small bug fixes.

* New API function: mesh/getDuplicateNodes

* New API functions: gmsh/isInitialized, occ/convertToNURBS, occ/getCurveLoops, occ/getSurfaceLoops, mesh/importStl, parser/getNames, parser/setNumber, parser/setString, parser/getNumber, parser(getString, parser/clear, parser/parse, onelab/getChanged, onelab/setChanged

4.9.3 (January 4, 2022): improved handling of degenerate curves in periodic surfaces and boundary layer extrusion; extended Mesh.SaveGroupsOfElements capabilities for INP export; extended Mesh.MeshSizeExtendFromBoundary + new "Extend" mesh size field to enable alternative mesh size extensions from boundary; enhanced X3D output; moved all kernel sources to src/ subdirectory; renamed demos/ as examples/ and tutorial/ as tutorials/; small bug fixes.

4.9.2 (December 23, 2021): faster projection on OCC entities; extended Mesh.SaveGroupsOfNodes capabilities for INP export; improved transfinite meshing of surfaces with boundary on periodic seam.

4.9.1 (December 18, 2021): relax tolerance on curve parametrization match for periodic meshing; enable extruded boundary layers on generic model entities; activate IncludeBoundary by default in Restrict field; downgraded compiler for official Linux releases to gcc 6 to improve compatibility with older systems; small bug fixes (view tag generation with zero tag, model/setTag).

4.9.0 (December 3, 2021): new initial 2D meshing algorithm; new quasi-structured quad algorithm; improved handling of imperfect curve reparametrization on
surfaces in 2D periodic meshing algorithm; mesh renumbering now also renumbers dependent post-processing views; the mesh size callback is now per-model and its returned value is not gathered with the other size constraints in a global min reduction anymore: instead the callback takes as additional argument the mesh size lc that would be prescribed in the absence of the callback, which allows to perform any desired modification (the old behavior can be achieved by returning \(\min(lc, \text{value})\)); OCC STL representation is now generated using relative deflection tolerance; new TransformMesh command in .geo files; new behavior of Mesh.SaveGroupsOf{Nodes,Elements} in UNV and INP exports; partitioned MSH4 files now contain the full partition topology (i.e. all partition entities); fixed metric calculation with Eigen (for anisotropic mesh generation); official binary builds now support OpenMP parallelization and are 64 bit only (build OS upgraded to Windows 10, macOS 10.15 and Linux glibc 2.24); new experimental Fortran API; new API functions to handle view options by tag instead of by index; color options in the API can now be specified as in .geo files, in the form "Category.Color.Option"; small bug fixes.

* New API functions: model/setTag, mesh/reverse, mesh/affineTransform, mesh/getMaxNodeTag, mesh/getMaxElementTag, mesh/getSizes, mesh/getPeriodic, mesh/getAllEdges, mesh/getAllFaces, mesh/addEdge, mesh/addFace, mesh/numberOfPartitions, field/list, field/getType, field/numberOf, field/getNumbers, field/getString, view/option/setNumber, view/option/getName, view/option/setString, view/option/getName, view/option/getColor, view/option/copied, view/option/copy.

* Incompatible API changes: new arguments to mesh/getNode, mesh/getElement and view/probe; additional argument to the mesh size callback function provided to mesh/setSizeCallback; new optional arguments to gmshinitialize, model/isInside, mesh/partition and occ/addSurfaceFilling; renamed mesh/preallocateBasisFunctionsOrientationForElements as mesh/preallocateBasisFunctionsOrientation, mesh/numberOfKeysForElements as mesh/numberOfKeys, and mesh/basisFunctionsOrientationForElements as mesh/basisFunctionsOrientation; renamed mesh/keysForElements as mesh/keys and mesh/informationForElements as mesh/keysInformation, and modified their arguments; modified arguments to mesh/keysForElement; removed mesh/localMultipliersForHcurl0; renamed view/copyOptions as view/copy.

4.8.2 (March 27, 2021): fixed regression in OCC transforms; fixed cwrap API.

4.8.1 (March 21, 2021): improved performance when transforming many OCC entities; fixed regression in high-order meshing of surfaces with singular parametrizations; small bug fixes.

4.8.0 (March 2, 2021): new interactive and fully parametrizable definition of boundary conditions, materials, etc. through ONELAB variables; new API functions for creating trimmed BSpline/Bezier patches, perform raw triangulations and
tetrahedralizations, get upward adjacencies, and create extruded boundary layers
and automatic curve loops in built-in kernel; improved performance of high-order
meshing of OCC models; improved handling of high resolution displays; new
structured CGNS exporter; new transfinite Beta law; added support for embedded
curves in HXT; added automatic conversion from partitioned MSH2 files to new
partitioned entities; element groups can now be imported from UNV files; fixed
order of Gauss quadrature for quads and hexas; code modernization (C++11);
further uniformization of option names to match the documented terminology
(Mesh.Point -> Mesh.Node, ...; old names are still accepted, but deprecated);
deprecated Mesh.MinimumElementsPerTwoPi: set value directly to
Mesh.MeshSizeFromCurvature instead; Python and Julia APIs now also define "snake
case" aliases for all camelCase function names; small bug fixes and
improvements.

* New API functions: model/getFileName, model/setFileName, model/getAdjacencies,
model/getSecondDerivative, mesh/getEdges, mesh/getFaces, mesh/createEdges,
mesh/createFaces, mesh/removeConstraints, mesh/getEmbedded, mesh/triangulate,
mesh/tetrahedralize, geo/addCurveLoops, fltk/setStatusMessage,
fltk/showContextWindow, fltk/openTreeItem, fltk/closeTreeItem,
onelab/getNames.

* Incompatible API changes: new optional arguments to mesh/classifySurfaces,
occ/addBSplineSurface, occ/addBezierSurface, occ/addPipe and view/probe;
renamed mesh/getEdgeNumber as mesh/getEdges.

4.7.0 (November 5, 2020): API errors now throw exceptions with the last error
message (instead of an integer error code); API functions now print messages on
the terminal by default, and throw exceptions on all errors unless in
interactive mode; new API functions to retrieve "homogeneous" model-based data
(for improved Python performance), to set interpolation matrices for high-order
datasets, to assign "automatic" transfinite meshing constraints and to pass
native (C++, C, Python or Julia) mesh size callback; added option to save
high-order periodic nodes info; added support for scripted window splitting;
improved VTK reader; new MatrixOfInertia command; added support for Unicode
command line arguments on Windows; uniformized commands, options and field
option names to match the documented terminology (CharacteristicLength ->
MeshSize, geometry Line -> Curve, ...; old names are still accepted, but
deprecated); improved handling of complex periodic cases; removed bundled Mmg3D
and added support for stock Mmg 5; Gmsh now requires C++11 and CMake 3.1, and
uses Eigen by default instead of Blas/Lapack for dense linear algebra; small bug
fixes.

* New API functions: model/setVisibilityPerWindow, mesh/setSizeCallback,
mesh/removeSizeCallback, mesh/setTransfiniteAutomatic, geo/addPhysicalGroup,
geo/removePhysicalGroups, view/setInterpolationMatrices,
view/setVisibilityPerWindow, fltk/splitCurrentWindow, fltk/setCurrentWindow,
logger/getLastError.

* Incompatible API changes: new optional argument to geo/addCurveLoop.
4.6.0 (June 22, 2020): new options to only generate initial 2D or 3D meshes (without node insertion), and to only mesh non-meshed entities; added ability to only remesh parts of discrete models; added support for mesh size fields and embedded points and surfaces in HXT; improved reparametrization and partitioning code; new OCC API functions to reduce the number of synchronizations for complex models; new OCC spline surface interfaces; new functions and options to control the first tag of entities, nodes and elements; fixed duplicated entities in STEP output; improved mesh subdivision and high-order pipeline; MED output now preserves node and element tags; small bug fixes.

* New API functions: model/getParametrizationBounds, model/isInside, model/getClosestPoint, model/reparametrizeOnSurface, mesh/rebuildElementCache, mesh/getBasisFunctionsOrientationForElements, mesh/getBasisFunctionsOrientationForElement, mesh/getNumberOfOrientations, mesh/preallocateBasisFunctionsOrientationForElements, mesh/setSizeAtParametricPoints, geo/setMaxTag, geo/getMaxTag, occ/addBSplineFilling, occ/addBezierFilling, occ/addBSplineSurface, occ/addBezierSurface, occ/setMaxTag, occ/getMaxTag, occ/getEntities, occ/getEntitiesInBoundingBox, occ/getBoundingBox, view/addHomogeneousModelData.

* Incompatible API changes: new optional arguments to mesh/clear, mesh/createTopology, mesh/createGeometry, occ/addThruSections, mesh/getPeriodicNodes; new arguments to mesh/getBasisFunctions; removed mesh/preallocateBasisFunctions, mesh/precomputeBasisFunctions and mesh/getBasisFunctionsForElements; renamed occ/setMeshSize as occ/mesh/setSize.

4.5.6 (March 30, 2020): better calculation of OCC bounding boxes using STL; API tutorials; small bug fixes.

* New API functions: view/addListDataString, view/getListDataStrings.

4.5.5 (March 21, 2020): tooltips in GUI to help discovery of scripting options; fixed MED IO of high-order elements; fixed OCC attribute search by bounding box; fix parsing of mac-encoded scripts; new RecombineMesh command; added support for extrusion of mixed-dimension entities with OCC; small bug fixes.

4.5.4 (February 29, 2020): periodic mesh optimization now ensures that the master mesh is not modified; code cleanup; small bug fixes.

4.5.3 (February 22, 2020): improved positioning of corresponding nodes on periodic entities; improved LaTeX output; improved curve splitting in reparametrization; new binary PLY reader; small compilation fixes.

* New API functions: mesh/getEdgeNumber, mesh/getLocalMultipliersForHcurl0.

4.5.2 (January 30, 2020): periodic meshes now obey reorientation constraints; physical group definitions now follow compound meshing constraints; small bug fixes and improvements.

* New API function: geo/splitCurve.
4.5.1 (December 28, 2019): new Min and Max commands in .geo files; Mesh.MinimumCirclePoints now behaves the same with all geometry kernels; fixed issue with UTF16-encoded home directories on Windows.

4.5.0 (December 21, 2019): changed default 2D meshing algorithm to Frontal-Delaunay; new compound Spline/BSpline commands; new MeshSizeFromBoundary command; new CGNS importer/exporter; new X3D exporter for geometries and meshes; improved surface mesh reclassification; new separate option to govern curvature adapted meshes (Mesh.MinimumElementsPerTwoPi and "-clcurv val"); improved handling of anisotropic surface meshes in 3D Delaunay; improved high-order periodic meshing; improved 2D boolean unions; file chooser type is now changeable at runtime; FLTK GUI can now be created and destroyed at will through the API; fixed regression in MeshAdapt for non-periodic surfaces with singularities; combining views now copies options; added API support for mesh compounds, per-surface mesh algorithm and mesh size from boundary; renamed plugin AnalyseCurvedMesh to AnalyseMeshQuality; fixed regression for built-in kernel BSplines on non-flat geometries (Sphere, PolarSphere); small fixes and improvements.

* New API functions: model/getCurrent, model/getParametrization, mesh/computeCrossField, mesh/setNode, mesh/getElementsByCoordinates, mesh/getLocalCoordinatesInElement, mesh/getNumberOfKeysForElements, mesh/setAlgorithm, mesh.setSizeFromBoundary, mesh/setComound, geo/addCompoundSpline, geo/addCompoundBSpline, fltk/isAvailable.

* Incompatible API changes: removed mesh/smooth (now handled by mesh/optimize like all other mesh optimizers); renamed logger/time to logger/getWallTime and logger/cputime to logger/getCpuTime; new arguments to mesh/optimize, mesh/getElementProperties and occ/healShapes; added optional argument to mesh/classifySurfaces and view/combine.

4.4.1 (July 25, 2019): small improvements (transfinite with degenerate curves, renumbering for some mesh formats, empty MSH file sections, tunable accuracy of compound meshes) and bug fixes (ellipse < pi, orientation and reclassification of compound parts, serendip pyramids, periodic MeshAdapt robustness, invalidate cache after mesh/addNodes).

4.4.0 (July 1, 2019): new STL remeshing workflow (with new ClassifySurfaces command in .geo files); added API support for color options, mesh optimization, recombination, smoothing and shape healing; exposed additional METIS options; improved support for periodic entities (multiple curves with the same start/end points, legacy MSH2 format, periodic surfaces with embedded entities); added mesh renumbering also after interactive mesh modifications; improved support for OpenCASCADE ellipse arcs; new interactive filter in visibility window; flatter GUI; small bug fixes.

* New API functions: option/setColor, option/getColor, mesh/optimize, mesh/recombine, mesh/smooth, mesh/clear, mesh/getNodesByElementType, occ/healShapes.

* Incompatible API changes: mesh/getJacobians and mesh/getBasisFunctions now
take integration points explicitly; mesh/setNodes and mesh/setElements have been replaced by mesh/addNodes and mesh/addElements; added optional arguments to mesh/classifySurfaces and occ/addSurfaceLoop; changed arguments of occ/addEllipseArc to follow geo/addEllipseArc.

4.3.0 (April 19, 2019): improved meshing of surfaces with singular parametrizations; added API support for aliasing and combining views, copying view options, setting point coordinates, extruding built-in CAD entities along normals and retrieving mass, center of mass and inertia from OpenCASCADE CAD entities; fixed regression introduced in 4.1.4 that could lead to non-deterministic 2D meshes; small bug fixes.

* New API functions: model/setCoordinates, occ/getMass, occ/getCenterOfMass, occ/getMatrixOfInertia, view/addAlias, view/copyOptions, view/combine

* Incompatible API changes: added optional arguments to mesh/getNodes and mesh/getElementByCoordinates.

4.2.3 (April 3, 2019): added STL export by physical surface; added ability to remove embedded entities; added handling of boundary entities in addDiscreteEntity; small bug fixes.

* New API functions: mesh/getKeysForElements, mesh/getInformationForElements, mesh/removeEmbedded.

4.2.2 (March 13, 2019): fixed regression in reading of extruded meshes; added ability to export one solid per surface in STL format.

4.2.1 (March 7, 2019): fixed regression for STEP files without global compound shape; added support for reading IGES labels and colors; improved search for shared library in Python and Julia modules; improved Plugin(MeshVolume); updates to the reference manual.

4.2.0 (March 5, 2019): new MSH4.1 revision of the MSH file format, with support for size_t node and element tags (see the reference manual for detailed changes); added support for reading STEP labels and colors with OCC CAF; changed default "Geometry.OCCTargetUnit" value to none (i.e. use STEP file coordinates as-is, without conversion); improved high-order mesh optimization; added ability to import groups of nodes from MED files; enhanced Plugin(Distance) and Plugin(SimplePartition); removed unmaintained plugins; removed default dependency on PETSc; small improvements and bug fixes.

* New API functions: model/setEntityName, model/getEntityName, model/removeEntityName.

* Incompatible API changes: changed type of node and element tags from int to size_t to support (very) large meshes; changed logger/start, mesh/getPeriodicNodes and mesh/setElementsByType.

4.1.5 (February 14, 2019): improved OpenMP parallelization, STL remeshing, mesh partitioning and high-order mesh optimization; bug fixes.
* New API function: mesh/classifySurfaces.

4.1.4 (February 3, 2019): improved ghost cell I/O; small improvements and bug fixes.

* New API functions: mesh/relocateNodes, mesh/getElementType, mesh/setElementsByType, mesh/getElementEdgeNodes, mesh/getElementFaceNodes, mesh/getGhostElements, mesh/splitQuadrangles.

4.1.3 (January 23, 2019): improved quad meshing; new options for automatic full-quad meshes; save nodesets also for physical points (Abaqus, Tochnog); small bug fixes.

* New API functions: model/removePhysicalName, model/getPartitions, mesh/unpartition.

4.1.2 (January 21, 2019): fixed full-quad subdivision if Mesh.SecondOrderLinear is set; fixed packing of parallelograms regression in 4.1.1.

4.1.1 (January 20, 2019): added support for general affine transformations with OpenCASCADE kernel; improved handling of boolean tolerance (snap vertices); faster crossfield calculation by default (e.g. for Frontal-Delaunay for quads algorithm); fixed face vertices for PyramidN; renamed ONELAB "Action" and "Button" parameters "ONELAB/Action" and "ONELAB/Button"; added support for actions on any ONELAB button; added API functions for selections in user interface.

* New API functions: occ/affineTransform, fltk/selectEntities, fltk/selectElements, fltk/selectViews.

4.1.0 (January 13, 2019): improved ONELAB and Fltk support in API; improved renumbering of mesh nodes/elements; major code refactoring.

* New API functions: fltk/update, fltk/awake, fltk/lock, fltk/unlock, onelab/setNumber, onelab/getNumber, onelab/setString, onelab(getString), onelab/clear, onelab/write, logger/time, logger/cputime.

* Incompatible API changes: changed onelab/get.

4.0.7 (December 9, 2018): fixed small memory leaks; removed unused code.

4.0.6 (November 25, 2018): moved private API wrappers to utils/wrappers; improved Gmsh 3 compatibility for high-order periodic meshes; fixed '-v 0' not being completely silent; fixed rendering of image textures on some OSes; small compilation fixes.

4.0.5 (November 17, 2018): new automatic hybrid mesh generation (pyramid layer) when 3D Delaunay algorithm is applied to a volume with quadrangles on boundary; improved robustness of 2D MeshAdapt algorithm; bug fixes.

4.0.4 (October 19, 2018): fixed physical names regression in 4.0.3.
Appendix D: Version history

395

4.0.3 (October 18, 2018): bug fixes.

* New API function: model/removePhysicalGroups.

4.0.2 (September 26, 2018): added support for creating MED files with specific MED (minor) version; small bug fixes.

4.0.1 (September 7, 2018): renumber mesh nodes/elements by default; new SendToServer command for nodal views; small bug fixes.

* New API functions: model/setVisibility, model/getVisibility, model/setColor, model/getColor.

4.0.0 (August 22, 2018): new C++, C, Python and Julia API; new MSH4 format; new mesh partitioning code based on Metis 5; new 3D tetrahedralization algorithm as default; new workflow for remeshing (compound entities as meshing constraints, CreateGeometry for mesh reparametrization); added support for general BSplines, fillets and chamfers with OpenCASCADE kernel and changed default BSpline parameters with the built-in kernel to match OpenCASCADE’s; STEP files are now be default interpreted in MKS units (see Geometry.OCCTargetUnit); improved meshing of surfaces with singular parametrizations (spheres, etc.); uniformized entity naming conventions (line/curve, vertex/node, etc.); generalized handling of "all" entities in geo file (using {} notation); added support for creating LSDYNA mesh files; removed old CAD creation factory (GModelFactory), old reparametrization code (G{Edge, Face, Region}Compound) and old partitioning code (Metis 4 and Chaco); various cleanups, bug fixes and enhancements.

3.0.6 (November 5, 2017): improved meshing of spheres; improved handling of mesh size constraints with OpenCASCADE kernel; implemented "Coherence" for OpenCASCADE kernel (shortcut for BooleanFragments); added GAMBIT Neutral File export; small improvements and bug fixes.

3.0.5 (September 6, 2017): bug fixes.

3.0.4 (July 28, 2017): moved vorometal code to plugin; OpenMP improvements; bug fixes.

3.0.3 (June 27, 2017): new element quality measures; Block->Box; minor fixes.

3.0.2 (May 13, 2017): improved handling of meshing constraints and entity numbering after boolean operations; improved handling of fast coarseness transitions in MeshAdapt; new TIKZ export; small bug fixes.

3.0.0 (April 13, 2017): new constructive solid geometry features and boolean operations using OpenCASCADE; improved graphical user interface for interactive, parametric geometry construction; new or modified commands in .geo files: SetFactory, Circle, Ellipse, Wire, Surface, Sphere, Block, Torus, Rectangle, Disk, Cylinder, Cone, Wedge, ThickSolid, ThruSections, Ruled ThruSections, Fillet, Extrude, BooleanUnion, BooleanIntersection, BooleanDifference, BooleanFragments, ShapeFromFile, Recursive Delete, Unique; "Surface" replaces...
the deprecated "Ruled Surface" command; faster 3D tetrahedral mesh optimization enabled by default; major code refactoring and numerous bug fixes.

2.16.0 (January 3, 2017): small improvements (list functions, second order hexes for MED, GUI) and bug fixes.

2.15.0 (December 4, 2016): fixed several regressions (multi-file partitioned grid export, mesh subdivision, old compound mesher); improved 2D boundary layer field & removed non-functional 3D boundary layer field; faster rendering of large meshes.

2.14.0 (October 9, 2016): new Tochnog file format export; added ability to remove last command in scripts generated interactively; ONELAB 1.3 with usability and performance improvements; faster "Coherence Mesh".

2.13.2 (August 18, 2016)): small improvements (scale labels, periodic and high-order meshes) and bug fixes.

2.13.0 (July 11, 2016): new ONELAB 1.2 protocol with native support for lists; new experimental 3D boundary recovery code and 3D refinement algorithm; better adaptive visualization of quads and hexahedra; fixed several regressions introduced in 2.12.

2.12.0 (March 5, 2016): improved interactive definition of physical groups and handling of ONELAB clients; improved full quad algorithm; added support for list of strings, trihedra elements and X3D format; improved message console; new colormaps; various bugs fixes and small improvements all over.

2.11.0 (November 7, 2015): new Else/ElseIf commands; new OptimizeMesh command; Plugin(ModifyComponents) replaces Plugin(ModifyComponent); new VTK and X3D outputs; separate 0/Ctrl+0 shortcuts for geometry/full model reload; small bug fixes in homology solver, handling of embedded entities, and Plugin(Crack).

2.10.1 (July 30, 2015): minor fixes.

2.10.0 (July 21, 2015): improved periodic meshing constraints; new Physical specification with both label and numeric id; images can now be used as glyphs in post-processing views, using text annotations with the ‘file:///’ prefix; Views can be grouped and organized in subtrees; improved visibility browser navigation; geometrical entities and post-processing views can now react to double-clicks, via new generic DoubleClicked options; new Get/SetNumber and Get/SetString for direct access to ONELAB variables; small bug fixes and code cleanups.

2.9.3 (April 18, 2015): updated versions of PETSc/SLEPc and OpenCASCADE/OCE libraries used in official binary builds; new Find() command; miscellaneous code cleanups and small fixes.
2.9.2 (March 31, 2015): added support for extrusion of embedded points/curves; improved hex-dominant algorithm; fixed crashes in quad algorithm; fix regression in MED reader introduced in 2.9.0; new dark interface mode.

2.9.1 (March 18, 2015): minor bug fixes.

2.9.0 (March 12, 2015): improved robustness of spatial searches (extruded meshes, geometry coherence); improved reproducibility of 2D and 3D meshes; added support for high resolution ("retina") graphics; interactive graph point commands; on-the-fly creation of onelab clients in scripts; general periodic meshes using affine transforms; scripted selection of entities in bounding boxes; extended string and list handling functions; many small improvements and bug fixes.

2.8.5 (Jul 9, 2014): improved stability and error handling, better Coherence function, updated onelab API version and inline parameter definitions, new background image modes, more robust Triangulate/Tetrahedralize plugins, new PGF output, improved support for string-index variable names in parser, small improvements and bug fixes all over the place.

2.8.4 (Feb 7, 2014): better reproducibility of 2D meshes; new mandatory 'Name' attribute to define onelab variables in DefineConstant[] & co; new -setnumber/-setstring command line arguments; small improvements and bug fixes.

2.8.3 (Sep 27, 2013): new quick access menu and multiple view selection in GUI; enhanced animation creation; many small enhancements and bug fixes.

2.8.2 (Jul 16, 2013): improved high order tools interface; minor bug fixes.

2.8.0 (Jul 8, 2013): improved Delaunay point insertion; fixed mesh orientation of plane surfaces; fixed mesh size prescribed at embedded points; improved display of vectors at COG; new experimental text string display engines; improved fullscreen mode; access time/step in transformations; new experimental features: AdaptMesh and Surface In Volume; accept unicode file paths on Windows; compilation and bug fixes.

2.7.1 (May 11, 2013): improved Delaunay point insertion; updated onelab; better Abaqus and UNV export; small bug and compilation fixes.

2.7.0 (Mar 9, 2013): new single-window GUI, with dynamically customizable widget tree; faster STEP/BRep import; arbitrary size image export; faster 2D Delaunay/Frontal algorithms; full option viewer/editor; many bug fixes.

2.6.0 (Jun 19, 2012): new quadrilateral meshing algorithms (Blossom and Delaunay-Frontal for quads); new solver module based on ONELAB project (requires FLTK 1.3); new tensor field visualization modes (eigenvectors, ellipsoid, etc.); added support for interpolation schemes in .msh file; added support for MED3
format; rescale viewport around visible entities (shift+1:1 in GUI); unified post-processing field export; new experimental stereo+camera visualization mode; added experimental BAMG & Mmg3D support for anisotropic mesh generation; new OCC cut & merge algorithm imported from Salome; new ability to connect extruded meshes to tetrahedral grids using pyramids; new homology solver; Abaqus (INP) mesh export; new Python and Java wrappers; bug fixes and small improvements all over the place.

2.5.0 (Oct 15, 2010): new compound geometrical entities (for remeshing and/or trans-patch meshing); improved mesh reclassification tool; new client/server visualization mode; new ability to watch a pattern of files to merge; new integrated MPEG export; new option to force the type of views dynamically; bumped mesh version format to 2.2 (small change in the meaning of the partition tags; this only affects partitioned (i.e. parallel) meshes); renamed several post-processing plugins (as well as plugin options) to make them easier to understand; many bug fixes and usability improvements all over the place.

2.4.2 (Sep 21, 2009): solver code refactoring + better IDE integration.

2.4.1 (Sep 1, 2009): fixed surface mesh orientation bug introduced in 2.4.0; mesh and graphics code refactoring, small usability enhancements and bug fixes.

2.4.0 (Aug 22, 2009): switched build system to CMake; optionally copy transfinite mesh constraints during geometry transformations; bumped mesh version format to 2.1 (small change in the $PhysicalNames section, where the group dimension is now required); ported most plugins to the new post-processing API; switched from MathEval to MathEx and Flu_Tree_Browser to Fl_Tree; small bug fixes and improvements all over the place.

2.3.1 (Mar 18, 2009): removed GSL dependency (Gmsh now simply uses Blas and Lapack); new per-window visibility; added support for composite window printing and background images; fixed string option affectation in parser; fixed surface mesh orientation for OpenCASCADE models; fixed random triangle orientations in Delaunay and Frontal algorithms.

2.3.0 (Jan 23, 2009): major graphics and GUI code refactoring; new full-quad/hexa subdivision algorithm; improved automatic transfinite corner selection (now also for volumes); improved visibility browser; new automatic adaptive visualization for high-order simplices; modified arrow size, clipping planes and transform options; many improvements and bug fixes all over the place.

2.2.6 (Nov 21, 2008): better transfinite smoothing and automatic corner selection; fixed high order meshing crashes on Windows and Linux; new uniform mesh refinement (thanks Brian!); fixed various other small bugs.

2.2.5 (Oct 25, 2008): Gmsh now requires FLTK 1.1.7 or above; various small improvements (STL and VTK mesh I/O, Netgen upgrade, Visual C++ support, Fields, Mesh.(Msh,Stl,...)Binary changed to Mesh.Binary) and bug fixes (pyramid interpolation, Chaco crashes).

2.2.4 (Aug 14, 2008): integrated Metis and Chaco mesh partitioners; variables
can now be deleted in geo files; added support for point datasets in model-based postprocessing views; small bug fixes.

2.2.3 (Jul 14, 2008): enhanced clipping interface; API cleanup; fixed various bugs (Plugin(Integrate), high order meshes, surface info crash).

2.2.2 (Jun 20, 2008): added geometrical transformations on volumes; fixed bug in high order mesh generation.

2.2.1 (Jun 15, 2008): various small improvements (adaptive views, GUI, code cleanup) and bug fixes (high order meshes, Netgen interface).

2.2.0 (Apr 19, 2008): new model-based post-processing backend; added MED I/O for mesh and post-processing; fixed BDF vertex ordering for 2nd order elements; replaced Mesh.ConstrainedBackgroundMesh with Mesh.CharacteristicLength{FromPoints,ExtendFromBoundary}; new Fields interface; control windows are now non-modal by default; new experimental 2D frontal algorithm; fixed various bugs.

2.1.1 (Mar 1, 2008): small bug fixes (second order meshes, combine views, divide and conquer crash, ...).

2.1.0 (Feb 23, 2008): new post-processing database; complete rewrite of post-processing drawing code; improved surface mesh algorithms; improved STEP/IGES/BREP support; new 3D mesh optimization algorithm; new default native file choosers; fixed 'could not find extruded vertex' in extrusions; many improvements and bug fixes all over the place.

2.0.8 (Jul 13, 2007): unused vertices are not saved in mesh files anymore; new plugin GUI; automatic GUI font size selection; renamed Plugin(DecomposeInSimplex) into Plugin(MakeSimplex); reintroduced enhanced Plugin(SphericalRaise); clarified meshing algo names; new option to save groups of nodes in UNV meshes; new background mesh infrastructure; many small improvements and small bug fixes.

2.0.7 (Apr 3, 2007): volumes can now be defined from external CAD surfaces; Delaunay/Tetgen algorithm is now used by default when available; re-added support for Plot3D structured mesh format; added ability to export external CAD models as GEO files (this only works for the limited set of geometrical primitives available in the GEO language, of course--so trying to convert e.g. a trimmed NURBS from a STEP file into a GEO file will fail); "lateral" entities are now added at the end of the list returned by extrusion commands; fixed various bugs.

2.0.0 (Feb 5, 2007): new geometry and mesh databases, with support for STEP and IGES import via OpenCASCADE; complete rewrite of geometry and mesh drawing code; complete rewrite of mesh I/O layer (with new native binary MSH format and support for import/export of I-deas UNV, Nastran BDF, STL, Medit MESH and VRML 1.0 files); added support for incomplete second order elements; new 2D and 3D meshing algorithms; improved integration of Netgen and TetGen algorithms; removed anisotropic meshing algorithm (as well as attractors); removed explicit region number specification in extrusions; option changes in the graphical
interface are now applied instantaneously; added support for offscreen rendering using OSMesa; added support for SVG output; added string labels for Physical entities; lots of other improvements all over the place.

1.65 (May 15, 2006): new Plugin(ExtractEdges); fixed compilation errors with gcc4.1; replaced Plugin(DisplacementRaise) and Plugin(SphericalRaise) with the more flexible Plugin(Warp); better handling of discrete curves; new Status command in parser; added option to renumber nodes in .msh files (to avoid holes in the numbering sequence); fixed 2 special cases in quad->prism extrusion; fixed saving of 2nd order hexas with negative volume; small bug fixes and cleanups.

1.64 (Mar 18, 2006): Windows versions do no depend on Cygwin anymore; various bug fixes and cleanups.

1.63 (Feb 01, 2006): post-processing views can now be exported as meshes; improved background mesh handling (a lot faster, and more accurate); improved support for input images; new Plugin(ExtractElements); small bug fixes and enhancements.

1.62 (Jan 15, 2006): new option to draw color gradients in the background; enhanced perspective projection mode; new "lasso" selection mode (same as "lasso" zoom, but in selection mode); new "invert selection" button in the visibility browser; new snapping grid when adding points in the GUI; nicer normal smoothing; new extrude syntax (old syntax still available, but deprecated); various small bug fixes and enhancements.

1.61 (Nov 29, 2005): added support for second order (curved) elements in post-processor; new version (1.4) of post-processing file formats; new stippling options for 2D plots; removed limit on allowed number of files on command line; all "Combine" operations are now available in the parser; changed View.ArrowLocation into View.GlyphLocation; optimized memory usage when loading many (>1000) views; optimized loading and drawing of line meshes and 2D iso views; optimized handling of meshes with large number of physical entities; optimized vertex array creation for large post-processing views on Windows/Cygwin; removed Discrete Line and Discrete Surface commands (the same functionality can now be obtained by simply loading a mesh in .msh format); fixed coloring by mesh partition; added option to light wireframe meshes and views; new "mesh statistics" export format; new full-quad recombine option; new Plugin(ModulusPhase); hexas and prisms are now always saved with positive volume; improved interactive entity selection; new experimental Tetgen integration; new experimental STL remeshing algorithm; various small bug fixes and improvements.

1.60 (Mar 15, 2005): added support for discrete curves; new Window menu on Mac OS X; generalized all octree-based plugins (CutGrid, StreamLines, Probe, etc.) to handle all element types (and not only scalar and vector triangles+tetrahedra); generalized Plugin(Evaluate), Plugin(Extract) and Plugin(Annotate); enhanced clipping plane interface; new grid/axes/rulers for 3D post-processing views (renamed the AbscissaName, NbAbscissa and AbscissaFormat options to more general names in the process); better automatic positioning of 2D graphs; new manipulator dialog to specify rotations, translations and
scalings "by hand"; various small enhancements and bug fixes.

1.59 (Feb 06, 2005): added support for discrete (triangulated) surfaces, either in STL format or with the new "Discrete Surface" command; added STL and Text output format for post-processing views and STL output format for surface meshes; all levelset-based plugins can now also compute isovolumes; generalized Plugin(Evaluate) to handle external view data (based on the same or on a different mesh); generalized Plugin(CutGrid); new plugins (Eigenvalues, Gradient, Curl, Divergence); changed default colormap to match Matlab's "Jet" colormap; new transformation matrix option for views (for non-destructive rotations, symmetries, etc.); improved solver interface to keep the GUI responsive during solver calls; new C++ and Python solver examples; simplified Tools->Visibility GUI; transfinite lines with "Progression" now allow negative line numbers to reverse the progression; added ability to retrieve Gmsh's version number in the parser (to help write backward compatible scripts); fixed white space in unv mesh output; fixed various small bugs.

1.58 (Jan 01, 2005): fixed UNIX socket interface on Windows (broken by the TCP solver patch in 1.57); bumped version number of default post-processing file formats to 1.3 (the only small modification is the handling of the end-of-string character for text2d and text3d objects in the ASCII format); new File->Rename menu; new colormaps+improved colormap handling; new color+min/max options in views; new GetValue() function to ask for values interactively in scripts; generalized For/EndFor loops in parser; new plugins (Annotate, Remove, Probe); new text attributes in views; renamed some shortcuts; fixed TeX output for large scenes; new option dialogs for various output formats; fixed many small memory leaks in parser; many small enhancements to polish the graphics and the user interface.

1.57 (Dec 23, 2004): generalized displacement maps to display arbitrary view types; the arrows representing a vector field can now also be colored by the values from other scalar, vector or tensor fields; new adaptive high order visualization mode; new options (Solver.SocketCommand, Solver.NameCommand, View.ArrowSizeProportional, View.Normals, View.Tangents and General.ClipFactor); fixed display of undesired solver plugin popups; enhanced interactive plugin behavior; new plugins (HarmonicToTime, Integrate, Eigenvectors); tetrahedral mesh file reading speedup (50% faster on large meshes); large memory footprint reduction (up to 50%) for the visualization of triangular/tetrahedral meshes; the solver interface now supports TCP/IP connections; new generalized raise mode (allows one to use complex expressions to offset post-processing maps); upgraded Netgen kernel to version 4.4; new optional TIME list in parsed views to specify the values of the time steps; several bug fixes in the Elliptic mesh algorithm; various other small bug fixes and enhancements.

1.56 (Oct 17, 2004): new post-processing option to draw a scalar view raised by a displacement view without using Plugin(DisplacementRaise) (makes drawing arbitrary scalar fields on deformed meshes much easier); better post-processing menu (arbitrary number of views+scrollable+show view number); improved view->combine; new horizontal post-processing scales; new option to draw the mesh nodes per element; views can now also be saved in "parsed" format; fixed various path problems on Windows; small bug fixes.
1.55 (Aug 21, 2004): added background mesh support for Triangle; meshes can now be displayed using "smoothed" normals (like post-processing views); added GUI for clipping planes; new interactive clipping/cutting plane definition; reorganized the Options GUI; enhanced 3D iso computation; enhanced lighting; many small bug fixes.

1.54 (Jul 03, 2004): integrated Netgen (3D mesh quality optimization + alternative 3D algorithm); Extrude Surface now always automatically creates a new volume (in the same way Extrude Point or Extrude Line create new lines and surfaces, respectively); fixed UNV output; made the "Layers" region numbering consistent between lines, surfaces and volumes; fixed home directory problem on Win98; new Plugin(CutParametric); the default project file is now created in the home directory if no current directory is defined (e.g., when double-clicking on the icon on Windows/Mac); fixed the discrepancy between the orientation of geometrical surfaces and the associated surface meshes; added automatic orientation of surfaces in surface loops; generalized Plugin(Triangulate) to handle vector and tensor views; much nicer display of discrete iso-surfaces and custom ranges using smooth normals; small bug fixes and cleanups.

1.53 (Jun 04, 2004): completed support for second order elements in the mesh module (line, triangles, quadrangles, tetrahedra, hexahedra, prisms and pyramids); various background mesh fixes and enhancements; major performance improvements in mesh and post-processing drawing routines (OpenGL vertex arrays for tri/quads); new Plugin(Evaluate) to evaluate arbitrary expressions on post-processing views; generalized Plugin(Extract) to handle any combination of components; generalized "Coherence" to handle transfinite surface/volume attributes; plugin options can now be set in the option file (like all other options); added "undo" capability during geometry creation; rewrote the contour guessing routines so that entities can be selected in an arbitrary order; Mac users can now double click on geo/msh/pos files in the Finder to launch Gmsh; removed support for FLTK 1.0; rewrote most of the code related to quadrangles; fixed 2d elliptic algorithm; removed all OpenGL display list code and options; fixed light positioning; new BoundingBox command to set the bounding box explicitly; added support for inexpensive "fake" transparency mode; many code cleanups.

1.52 (May 06, 2004): new raster ("bitmap") PostScript/EPS/PDF output formats; new Plugin(Extract) to extract a given component from a post-processing view; new Plugin(CutGrid) and Plugin(StreamLines); improved mesh projection on non-planar surfaces; added support for second order tetrahedral elements; added interactive control of element order; refined mesh entity drawing selection (and renamed most of the corresponding options); enhanced log scale in post-processing; better font selection; simplified View.Raise\{X,Y,Z\} by removing the scaling; various bug fixes (default postscript printing mode, drawing of 3D arrows/cylinders on Linux, default home directory on Windows, default initial file browser directory, extrusion of points with non-normalized axes of rotation, computation of the scene bounding box in scripts, + the usual documentation updates).

1.51 (Feb 29, 2004): initial support for visualizing mesh partitions; integrated version 2.0 of the MSH mesh file format; new option to compute post-processing ranges (min/max) per time step; Multiple views can now be combined into multi
Appendix D: Version history

1.50 (Dec 06, 2003): small changes to the visibility browser + made visibility scriptable (new Show/Hide commands); fixed (rare) crash when deleting views; split File->Open into File->Open and File->New to behave like most other programs; Mac versions now use the system menu bar by default (if possible); fixed bug leading to degenerate and/or duplicate tetrahedra in extruded meshes; fixed crash when reloading sms meshes.

1.49 (Nov 30, 2003): made Merge, Save and Print behave like Include (i.e., open files in the same directory as the main project file if the path is relative); new Plugin(DecomposeInSimplex); new option View.AlphaChannel to set the transparency factor globally for a post-processing view; new "Combine Views" command; various bug fixes and cleanups.

1.48 (Nov 23, 2003): new DisplacementRaise plugin to plot arbitrary fields on deformed meshes; generalized CutMap, CutPlane, CutSphere and Skin plugins to handle all kinds of elements and fields; new "Save View[n]" command to save views from a script; many small bug fixes (configure tests for libpng, handling of erroneous options, multi time step scalar prism drawings, copy of surface mesh attributes, etc.).

1.47 (Nov 12, 2003): fixed extrusion of surfaces defined by only two curves; new syntax to retrieve point coordinates and indices of entities created through geometrical transformations; new PDF and compressed PostScript output formats; fixed numbering of elements created with "Extrude Point/Line"; use $GMSH_HOME as home directory if defined.

1.46 (Aug 23, 2003): fixed crash for very long command lines; new options for setting the displacement factor and Triangle’s parameters + renamed a couple of options to more sensible names (View.VectorType, View.ArrowSize); various small bug fixes; documentation update.

1.45 (Jun 14, 2003): small bug fixes (min/max computation for tensor views, missing physical points in read mesh, "jumping" geometry during interactive manipulation of large models, etc.); variable definition speedup; restored support for second order elements in one- and two-dimensional meshes; documentation updates.

1.44 (Apr 21, 2003): new reference manual; added support for PNG output; fixed small configure script bugs.

1.43 (Mar 28, 2003): fixed solver interface problem on Mac OS X; new option to specify the interactive rotation center (default is now the pseudo "center of gravity" of the object, instead of (0,0,0)).
1.42 (Mar 19, 2003): suppressed the automatic addition of a ".geo" extension if the file given on the command line is not recognized; added missing Layer option for Extrude Point; fixed various small bugs.

1.41 (Mar 04, 2003): Gmsh is now licensed under the GNU General Public License; general code cleanup (indent).

1.40 (Feb 26, 2003): various small bug fixes (mainly GSL-related).

1.39 (Feb 23, 2003): removed all non-free routines; more build system work; implemented Von-Mises tensor display for all element types; fixed small GUI bugs.

1.38 (Feb 17, 2003): fixed custom range selection for 3D iso graphs; new build system based on autoconf; new image reading code to import bitmaps as post-processing views.

1.37 (Jan 25, 2003): generalized smoothing and cuts of post-processing views; better Windows integration (solvers, external editors, etc.); small bug fixes.

1.36 (Nov 20, 2002): enhanced view duplication (one can now use "Duplicata View[num]" in the input file); merged all option dialogs in a new general option window; enhanced discoverability of the view option menus; new 3D point and line display; many small bug fixes and enhancements ("Print" format in parser, post-processing statistics, smooth normals, save window positions, restore default options, etc.).

1.35 (Sep 11, 2002): graphical user interface upgraded to FLTK 1.1 (tooltips, new file chooser with multiple selection, full keyboard navigation, cut/paste of messages, etc.); colors can now be directly assigned to mesh entities; initial tensor visualization; new keyboard animation (right/left arrow for time steps; up/down arrow for view cycling); new VRML output format for surface meshes; new plugin for spherical elevation plots; new post-processing file format (version 1.2) supporting quadrangles, hexahedra, prisms and pyramids; transparency is now enabled by default for post-processing plots; many small bug fixes (read mesh, ...).

1.34 (Feb 18, 2002): improved surface mesh of non-plane surfaces; fixed orientation of elements in 2D anisotropic algorithm; minor user interface polish and additions (mostly in post-processing options); various small bug fixes.

1.33 (Jan 24, 2002): new parameterizable solver interface (allowing up to 5 user-defined solvers); enhanced 2D aniso algorithm; 3D initial mesh speedup.

1.32 (Oct 04, 2001): new visibility browser; better floating point exception checks; fixed infinite looping when merging meshes in project files; various small clean ups (degenerate 2D extrusion, view->reload, ...).

1.31 (Nov 30, 2001): corrected ellipses; PostScript output update (better shading, new combined PS/LaTeX output format); more interface polish; fixed extra memory allocation in 2D meshes; Physical Volume handling in unv format; various small fixes.
1.30 (Nov 16, 2001): interface polish; fix crash when extruding quadrangles.

1.29 (Nov 12, 2001): translations and rotations can now be combined in extrusions; fixed coherence bug in Extrude Line; various small bug fixes and additions.

1.28 (Oct 30, 2001): corrected the 'Using Progression' attribute for transfinite meshes to actually match a real geometric progression; new Triangulate plugin; new 2D graphs (space+time charts); better performance of geometrical transformations (warning: the numbering of some automatically created entities has changed); new text primitives in post-processing views (file format updated to version 1.1); more robust mean plane computation and error checks; various other small additions and clean-ups.

1.27 (Oct 05, 2001): added ability to extrude curves with Layers/Recombine attributes; new PointSize/LineWidth options; fixed For/EndFor loops in included files; fixed error messages (line numbers+file names) in loops and functions; made the automatic removal of duplicate geometrical entities optional (Geometry.AutoCoherence=0); various other small bug fixes and clean-ups.

1.26 (Sep 06, 2001): enhanced 2D anisotropic mesh generator (metric intersections); fixed small bug in 3D initial mesh; added alternative syntax for built-in functions (for GetDP compatibility); added line element display; Gmsh now saves all the elements in the mesh if no physical groups are defined (or if Mesh.SaveAll=1).

1.25 (Sep 01, 2001): fixed bug with mixed recombined/non-recombined extruded meshes; Linux versions are now build with no optimization, due to bugs in gcc 2.95.X.

1.24 (Aug 30, 2001): fixed characteristic length interpolation for Splines; fixed edge swapping bug in 3D initial mesh; fixed degenerated case in geometrical extrusion (ruled surface with 3 borders); fixed generation of degenerated hexahedra and prisms for recombined+extruded meshes; added BSplines creation in the GUI; integrated Jonathan Shewchuk's Triangle as an alternative isotropic 2D mesh generator; added AngleSmoothNormals to control sharp edge display with smoothed normals; fixed random crash for lighted 3D iso surfaces.

1.23 (Aug, 2001): fixed duplicate elements generation + non-matching tetrahedra faces in 3D extruded meshes; better display of displacement maps; fixed interactive ellipsis construction; generalized boundary operator; added new explode option for post-processing views; enhanced link view behavior (to update only the changed items); added new default plugins: Skin, Transform, Smooth; fixed various other small bugs (mostly in the post-processing module and for extruded meshes).

1.22 (Aug 03, 2001): fixed (yet another) bug for 2D mesh in the mean plane; fixed surface coherence bug in extruded meshes; new double logarithmic scale, saturate value and smoothed normals option for post-processing views; plugins are now enabled by default; three new experimental statically linked plugins: CutMap (extracts a given iso surface from a 3D scalar map), CutPlane (cuts a 3D
scalar map with a plane section), CutSphere (cuts a 3D scalar map with a sphere); various other bug fixes, additions and clean-ups.

1.21 (Jul 25, 2001): fixed more memory leaks; added -opt command line option to parse definitions directly from the command line; fixed missing screen refreshes during contour/surface/volume selection; enhanced string manipulation functions (Sprintf, StrCat, StrPrefix); many other small fixes and clean-ups.

1.20 (Jun 14, 2001): fixed various bugs (memory leaks, functions in included files, solver command selection, ColorTable option, duplicate nodes in extruded meshes (not finished yet), infinite loop on empty views, orientation of recombined quadrangles, ...); reorganized the interface menus; added constrained background mesh and mesh visibility options; added mesh quality histograms; changed default mesh colors; reintegrated the old command-line extrusion mesh generator.

1.19 (May 07, 2001): fixed seg. fault for scalar simplex post-processing; new Solver menu; interface for GetDP solver through sockets; fixed multiple scale alignment; added some options + full option descriptions.

1.18 (Apr 26, 2001): fixed many small bugs and incoherences in post-processing; fixed broken background mesh in 1D mesh generation.

1.17 (Apr 17, 2001): corrected physical points saving; fixed parsing of DOS files (carriage return problems); easier geometrical selections (cursor change); plugin manager; enhanced variable arrays (sublist selection and affectation); line loop check; New arrow display; reduced number of 'fatal' errors + better handling in interactive mode; fixed bug when opening meshes; enhanced File->Open behavior for meshes and post-processing views.

1.16 (Feb 26, 2001): added single/double buffer selection (only useful for Unix versions of Gmsh run from remote hosts without GLX); fixed a bug for recent versions of the opengl32.dll on Windows, which caused OpenGL fonts not to show up.

1.15 (Feb 23, 2001): added automatic visibility setting during entity selection; corrected geometrical extrusion bug.

1.14 (Feb 17, 2001): corrected a few bugs in the GUI (most of them were introduced in 1.13); added interactive color selection; made the option database bidirectional (i.e. scripts now correctly update the GUI); default options can now be saved and automatically reloaded at startup; made some changes to the scripting syntax (PostProcessing.View[n] becomes View[n]; Offset0 becomes OffsetX, etc.); corrected the handling of simple triangular surfaces with large characteristic lengths in the 2D isotropic algorithm; added an ASCII to binary post-processing view converter.

1.13 (Feb 09, 2001): added support for JPEG output on Windows.

1.12: corrected vector lines in the post-processing parsed format; corrected animation on Windows; corrected file creation in scripts on Windows; direct affectation of variable arrays.
1.11 (Feb 07, 2001): corrected included file loading problem.

1.10 (Feb 04, 2001): switched from Motif to FLTK for the GUI. Many small tweaks.

1.00 (Jan 15, 2001): added PPM and YUV output; corrected nested If/Endif; Corrected several bugs for pixel output and enhanced GIF output (dithering, transparency); slightly changed the post-processing file format to allow both single and double precision numbers.

0.999 (Dec 20, 2000): added JPEG output and easy MPEG generation (see t8.geo in the tutorial); clean up of export functions; small fixes; Linux versions are now compiled with gcc 2.95.2, which should fix the problems encountered with Mandrake 7.2.

0.998 (Dec 19, 2000): corrected bug introduced in 0.997 in the generation of the initial 3D mesh.

0.997 (Dec 14, 2000): corrected bug in interactive surface/volume selection; Added interactive symmetry; corrected geometrical extrusion with rotation in degenerated or partially degenerated cases; corrected bug in 2D mesh when meshing in the mean plane.

0.996: arrays of variables; enhanced Printf and Sprintf; Simplified options (suppression of option arrays).

0.995 (Dec 11, 2000): totally rewritten geometrical database (performance has been drastically improved for all geometrical transformations, and most notably for extrusion). As a consequence, the internal numbering of geometrical entities has changed: this will cause incompatibilities with old .geo files, and will require a partial rewrite of your old .geo files if these files made use of geometrical transformations. The syntax of the .geo file has also been clarified. Many additions for scripting purposes. New extrusion mesh generator. Preliminary version of the coupling between extruded and Delaunay meshes. New option and procedural database. All interactive operations can be scripted in the input files. See the last example in the tutorial for an example. Many stability enhancements in the 2D and 3D mesh algorithms. Performance boost of the 3D algorithm. Gmsh is still slow, but the performance becomes acceptable. An average 1000 tetrahedra/second is obtained on a 600Mhz computer for a mesh of one million tetrahedra. New anisotropic 2D mesh algorithm. New (ASCII and binary) post-processing file format and clarified mesh file format. New handling for interactive rotations (trackball mode). New didactic interactive mesh construction (watch the Delaunay algorithm in real time on complex geometries: that’s exciting ;-) ). And many, many bug fixes and cleanups.

0.992 (Nov 13, 2000): corrected recombined extrusion; corrected ellipses; added simple automatic animation of post-processing maps; fixed various bugs.

0.991 (Oct 24, 2000): fixed a serious allocation bug in 2D algorithm, which caused random crashes. All users should upgrade to 0.991.
0.990: bug fix in non-recombined 3D transfinite meshes.

0.989 (Sep 01, 2000): added ability to reload previously saved meshes; some new command line options; reorganization of the scale menu; GIF output.

0.987: fixed bug with smoothing (leading to the possible generation of erroneous 3d meshes); corrected bug for mixed 3D meshes; moved the 'toggle view link' option to Opt->Postprocessing_Options.

0.986: fixed overlay problems; SGI version should now also run on 32 bits machines; fixed small 3d mesh bug.

0.985: corrected colormap bug on HP, SUN, SGI and IBM versions; corrected small initialization bug in postscript output.

0.984: corrected bug in display lists; added some options in Opt->General.

0.983: corrected some seg. faults in interactive mode; corrected bug in rotations; changed default window sizes for better match with 1024x768 screens (default X resources can be changed: see ex03.geo).

0.982: lighting for mesh and post-processing; corrected 2nd order mesh on non plane surfaces; added example 13.

and

Jean-Francois Remacle
<jf.remacl at uclouvain.be>

Code contributions to Gmsh have been provided by David Colignon (colormaps), Emilie Marchandise (old compound geometrical entities), Gaetan Bricteux (Gauss integration and levelsets), Jacques Lechelle (DIFPACK export), Jonathan Lambrechts (mesh size fields, solver, Python wrappers), Jozef Vesely (old Tetgen integration), Koen Hillewaert (high order elements, generalized periodic meshes), Laurent Stainier (eigenvalue solvers, tensor display and help with macOS port), Marc Ume (original list and tree code), Mark van Doesburg (old OpenCASCADE face connection), Matt Gundry (Plot3d export), Matti Pellikka (cell complex and homology solver), Nicolas Tardieu (help with Netgen integration), Pascale Noyret (MED mesh IO), Pierre Badel (root finding and minimization), Ruth Sabariego (pyramids), Stephen Guzik (old CGNS IO, old partitioning code), Bastien Gorissen (parallel remote post-processing), Eric Bechet (solver), Gilles Marckmann (camera and stereo mode, X3D export), Ashish Negi (Netgen CAD healing), Trevor Strickler (hybrid structured mesh coupling with pyramids), Amaury Johnen (Bezier code, high-order element validity), Benjamin Ruard (old Java wrappers), Maxime Graulich (iOS/Android port), Francois Henrotte (ONELAB metamodels), Sebastian Eiser (PGF export), Alexis Salzman (compressed IO), Hang Si (TetGen/BR boundary recovery code), Fernando Lorenzo (Tochnog export), Larry Price (Gambit export), Anthony Royer (new partitioning code, MSH4 IO), Darcy Beurle (code cleanup and performance improvements), Celestin Marot (HXT/tetMesh), Pierre-Alexandre Beaufort (HXT/reparam), Zhidong Han (LSDYNA export), Ismail Badia (hierarchical basis functions), Jeremy Theler (X3D export), Thomas Toulorge (high order mesh optimizer, new CGNS IO), Max Orok (binary PLY), Marek Wojciechowski (PyPi packaging), Maxence Reberol (automatic transfinite, quad meshing tools), Michael Ermakov (Gambit export, Fortran API, TransfiniteTri, boundary layer fans), Alex Krasner (X3D export), Giannis Nikiteas (Fortran API), Paul Sharp (Radioss export). See comments in the sources for more information. If we forgot to list your contributions please send us an email!

Thanks to the following folks who have contributed by providing fresh ideas on theoretical or programming topics, who have sent patches, requests for changes or improvements, or who gave us access to exotic machines for testing Gmsh: Juan Abanto, Olivier Adam, Guillaume Alleon, Laurent Champanay, Pascal Dupuis, Patrick Dular, Philippe Geuzaine, Johan Gyselinck, Francois Henrotte, Benoit Meys, Nicolas Moes, Osamu Nakamura, Chad Schmutzer, Jean–Luc Fléjou, Xavier Dardenne, Christophe Prud’homme, Sebastien Clerc, Jose Miguel Pasini, Philippe Lussou, Jacques Kools, Bayram Yenikaya, Peter Hornby, Krishna Mohan Gundu, Christopher Stott, Timmy Schumacher, Carl Ostervisch, Bruno Frackowiak, Philip Kelleners, Romuald Conty, Renaud Sizaire, Michel Benhamou, Tom De Vuyst, Kris Van den Abeele, Simon Vun, Simon Corbin, Thomas De-Soza, Marcus Drosson, Antoine
Dechaume, Jose Paulo Moitinho de Almeida, Thomas Pinchard, Corrado Chisari, Axel Hackbarth, Peter Wainwright, Jiri Hnidek, Thierry Thomas, Konstantinos Poullos, Laurent Van Mieghem, Shahroksh Ghavamian, Geordie McBain, Jose Paulo Moitinho de Almeida, Guillame Demesny, Wendy Merks-Swolfs, Cosmin Stefan Deaconu, Nigel Nunn, Serban Georgescu, Julien Troufflard, Michele Mocciola, Matthijs Sypkens Smit, Sauli Ruuska, Romain Boman, Fredrik Ekre, Mark Burton, Max Orok, Paul Cristini, Isuru Fernando, Jose Paulo Moitinho de Almeida, Sophie Le Bras, Alberto Escrig, Samy Mukadi, Peter Johnston, Bruno de Sousa Alves, Stefan Bruens, Luca Verzeroli, Tristan Seidlhofer, Ding Jiaming, Joost Gevaert, Marcus Calhoun-Lopez, Michel Zou, Sir Sunsheep, Mariano Forti, Walter Steffe, Nico Schloemer, Simon Tournier, Alexandru Dadalau, Thomas Ulrich, Matthias Diener, Jamie Border; Kenneth Jansen; Steven Masfaraud; Sai Sumanth Moturu; Arie Westland; Andreas Farley; Mahesh Madhav; Zoltan Csati; Christophe Bourcier; Matteo Couplelet, Mahesh Madhav, Giuseppe Musacchio, Romin Tomassetti.

Special thanks to Bill Spitzak, Michael Sweet, Matthias Melcher, Greg Ercolano and others for the Fast Light Tool Kit on which Gmsh's GUI is based. See http://www.fltk.org for more info on this excellent object-oriented, cross-platform toolkit. Special thanks also to EDF for funding the original OpenCASCADE and MED integration in 2006-2007. Gmsh development was also financially supported by the PRACE project funded in part by the EU's Horizon 2020 Research and Innovation programme (2014-2020) under grant agreement 823767.

The TetGen/BR code (src/mesh/tetgenBR.{cpp,h}) is copyright (c) 2016 Hang Si, Weierstrass Institute for Applied Analysis and Stochastics. It is relicensed under the terms of LICENSE.txt for use in Gmsh thanks to a Software License Agreement between Weierstrass Institute for Applied Analysis and Stochastics and GMESH SPRL.

The AVL tree code (src/common/avl.{cpp,h}) and the YUV image code (src/graphics/gl2yuv.{cpp,h}) are copyright (C) 1988-1993, 1995 The Regents of the University of California. Permission to use, copy, modify, and distribute this software and its documentation for any purpose and without fee is hereby granted, provided that the above copyright notice appear in all copies and that both that copyright notice and this permission notice appear in supporting documentation, and that the name of the University of California not be used in advertising or publicity pertaining to distribution of the software without specific, written prior permission. The University of California makes no representations about the suitability of this software for any purpose. It is provided "as is" without express or implied warranty.

The picojson code (src/common/picojson.h) is Copyright 2009-2010 Cybozu Labs, Inc., Copyright 2011-2014 Kazuho Oku, All rights reserved. * contrib/voro++ from Voro++ Copyright (c) 2008, The Regents of the University of California, through Lawrence Berkeley National Laboratory (subject to receipt of any required approvals from the U.S. Dept. of Energy). All rights reserved;

* contrib/zipper from MiniZip – Copyright (c) 1998-2010 – by Gilles Vollant – version 1.1 64 bits from Mathias Svensson.

Check the configuration options to see which have been enabled.
Appendix F License

Gmsh is provided under the terms of the GNU General Public License (GPL), Version 2 or later, with the following exception:

The copyright holders of Gmsh give you permission to combine Gmsh with code included in the standard release of Netgen (from Joachim Schöberl), METIS (from George Karypis at the University of Minnesota), OpenCASCADE (from Open CASCADE S.A.S) and ParaView (from Kitware, Inc.) under their respective licenses. You may copy and distribute such a system following the terms of the GNU GPL for Gmsh and the licenses of the other code concerned, provided that you include the source code of that other code when and as the GNU GPL requires distribution of source code.

Note that people who make modified versions of Gmsh are not obligated to grant this special exception for their modified versions; it is their choice whether to do so. The GNU General Public License gives permission to release a modified version without this exception; this exception also makes it possible to release a modified version which carries forward this exception.

End of exception.

GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software—-to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation’s software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid
anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author’s protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors’ reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone’s free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program’s source code as you receive it, in any medium, provided that you
conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.
3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

   a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the
Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest
to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program’s name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) <year> name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'. This is free software, and you are welcome to redistribute it under certain conditions; type 'show c' for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items—whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.
